Did you experience that irritating thing where the default settings never came up when you start uniterm? No matter what I do I get an error-reading-default error box and I have to load the defaults manualy - or does this vanish if you register?

If this is so and Simon Poole can be located I will pay up and get a registered copy.

What`s wrong with this filename? In my opinion it`s a great filename since you just CAN`T mistake it for something else. BTW, if you didn`t know Roger the Internet is one big anarchy which means we just don`t have to listen to you (thank god for that!).

> I am unable to get this file via Gopher or a mail server..??

Why is it impossible to get via mail? Is it because you don`t know how to do it or because you don`t know how to do it? And for those who knows how to use it there`s also FTP...

> Or is it just a joke, and the file is not there...

Come on Roger, do you honestly think someone would want to fool you? ;-)

> How about some Standards Thanks...

You`re the "facts man", why don`t you provide us with some hard, and most probably very wrong, facts about standards? Not that it would make any difference, but it would certainly make for a fun discussion...

> working though. :-(
>

I seem to recall that back in the days when the PC XT was flavour of the month somebody came up with something a bit like LapLink that worked through either parallel or serial ports but got a decent speed through the serial port by toggling the handshake lines so that the serial port transmitted effectively a four bit word (nibble?) in parallel. Back then, 19.2k was considered fast on a comms port but was much too slow transfering the contents of an entire HD. I think the effective throughput of this scheme was somewhere around 5 megabit/sec on an XT.

It would be interesting to try this on an Atari. Does anybody have any data on delay times of atari serial handshake lines? Of course, the down side of all this is that the atari only has one serial port (I dont know about the newer models).

Is this a dumb idea? Too hard? At least with serial you are very unlikely to blow anything up if you wire it wrong - provided you plug it into the right socket :-)

Hello fellow Atarians.
I am hoping someone can tell me where I might be able to find/ftp any fractal music composing software ? I believe there is a prog. called Datamusic Fractul Music.
I am also after any information regarding the Composers Desktop Project (CDP) and any of the software they produced especially MIDI GRID.
Any help would be much appreciated.

How much did you pay for your RAM board?
Would I be right in thinking that to get the 32bit access you need 4
Simms of either 1 MB or 4 MB each?

Also , not wishing to start an arguement, do you mean 30 pin simms or
72 pins? I was not aware of 32 pin simms.

: > * faster than a TT (Qindex? Gembench?)

I can vouch for this speed - and I have not even tested it running
NVDI yet!

: > ? FPU slot

: Yep, most certainly so. And the FPU can have a different, higher clock than
: the CPU. I am aware of one PAK with 60 MHz CPU- and 70 MHz FPU-clock with a
: mainboard clock of 10 MHz (or was it 12, not sure ATM).

Are you sure about this? On the piece of paper I have telling me the
jumper positions it says WARNING: FPU MUST NOT RUN AT HIGHER SPEED
THAN CPU or words to that effect.

: > ? Linux development

: Will work on a PAK if you have the FPU.

This is VERY good news - last I'd heard PAK wasn't yet supported. But
I did read that in an OLD FAQ.

Message-ID: <950207Z100756.903barheath@heathen.demon.co.uk>
Source record: 171918

I agree with Hutch and the others who object to Richard's use of a full sig in a quoted message. It is somewhat superfluous, as, if you quote properly and leave in the <From...> line in the header, we'll all know who it's from. Let's face it, we probably read the original anyway, so we know who it 's from.
However this is not half so annoying as a few other habits, which, though not prevalent in this group, certainly appear all over the net. One is double spaced messages (apparently the fault of a poorly set up server) another is a quote of about five pages followed by a one line comment, whilst the third is a quote that includes a full header.

When I started netting, I took note of the etiquette list in one of the magazines, yet was surprised to see so much ignoring it. For those who don't know, the relevant parts are reproduced below:
1. DON'T SHOUT. Typing in capitals is the equivalent to shouting a conversation, and just as annoying.
2. Don't post objectionable or insulting material unless you are prepared for a hard drive full of hate mail. (This won't necessarily apply to some of the more controversial alt.xxxx groups)
3. Don't quote a whole article in reply if all you are going to do is add "I agree" at the end. Even people who don't have to pay the cost of the extra space get annoyed at having to troll through page after page of the same thing.
4. Don't use more than four lines for your signature unless it is absolutely necessary.

My view is, 1 is ok, 2 is your own lookout, 3 just means learning to use your editor properly, and learning to extract relevant info, and 4, well I can't say too much there, can I? - though I have seen some that just go toooo far!

I'd be interested to know how others in this group feel.
Cheers all,

Bazza

I have an ATBUS TOS CARD from Hard&Soft Germany. This card is soldered onto the CPU. I have a 2.5 IDE HD and it works fine with the internal PSU. The internal PSU is probably not strong enough for a 3.5 IDE HD. The card comes with TOS 2.06 and the HD will autoboot under TOS 2.06.

Does anyone know how I can contact the editor or published of the (now defunct) Monitor magazine? I've tried writing to their P.O. Box, but have had no reply. I'm trying to get permission to reproduce programs from the magazine.

Alternatively, does anyone know if the contents of Monitor have been put into the public domain?

Thanks,

It's not a stripped down xterm, it's a totally different program by a
different author.... it's called xvt, and the atari version can be
got from http://www.ncl.ac.uk/~n08z7 or ftp phlem.ph.kcl.ac.uk

>should the files in X11R5.zoo be placed in my directory?

Everyone seems to get this problem. xinit searches your PATH for the
executable file X (which is the X server) if this isn't in your PATH,
xinit won't work. One way to fix this is to do the following:

In MiNT.cnf :

INIT=login

In passwd, set your shell to be init (the really simple shell that originally
came with MiNT - 'coz it uses little memory).

Put an INIT.RC file in your home directory which sets up your path properly
so that X is found, then runs xinit.

Viola - X Windows.

Craig.

> make or sell computers?

Basically, they are out of the computer business...trying desperately to
survivie as a game company.

> Should I bother upgrading, or should I bail?

That's a tough one...I've got an old single floppy 1 meg ST with TOS 1.0.
To make it usable for anything other than pretty basic memo making and
gaming, I'd have to upgrade memory, upgrade TOS, and add a hard drive...but
then I've still got an 8mhz 68000 computer...quite frankly it ain't worth
doing, but I'm not getting rid of it either. I'll get by until PREP
machines are available...buy some HW, pick the OS that best runs the SW,
and get on with it...

|> Ok I know quite alot about the PAK3 but still have a few questions.
|>
|> 1) Does anyone sell the board in kit form (I wish to minimise cost)
|>
|> 2) What Fast Ram options are there and how much do they cost?
|>
|> 3) Are there any graphics boards available yet if so what are they,
|> are they compatable with NVDI ET4000 drivers if not what SW is
|> available and the good old how much would they cost.

Hi Dave

There's a german speaking newsgroup called maus.sys.atari.hardware.
In this newsgroup one of the developers of the PAK is supporting his work!
Perhaps, if you are friendly, you can try your question again in that newsgroup
-- even when it's in English!

to 1.> Yes, here in Germany there's a distributor who sells it in a kit
form! (I
get it there).

to 2.> You mean FAST RAM or the CACHE on the PAK?? There's also a FAST-RAM card
available from the developers where you can put in 4 normal SIMMs!
The Cache on the PAK is very necessary to speed up the PAK but I don't know the
prices anylonger.

to 3.> Yes, you can buy a card where you can put in normal ET4000 grafik-cards!

Bye

...Patrick

It's really fantastic !
I just finnished the Okami Newsreader setup in my computer and i can
say that it is really the best Off Line reader for ST i have ever
tried before !!!!
First of all, it works with Soup & UUCP mail package's which can be
easily created using the famous UQWK proram for Unix, Linux e.t.c.
I suggest to use Soup format..its the best format for offline reading
of Usenet Newsgroups and private mail. The configuration is easy and
the documents included in the package (Engl. & German) are very good.
From now on, i can say that i will never have to read the newsgroups
using rn, tin, pine or anything like this...ST is the best solution!
As i said before you will need : UQWK program for Unix (can be found
on most ftp sites) and Okami Newsreder (version 026) found on Hensa,
Umich and mirrors. Read the nice docs, setup okami and you are ready!

P.S. I Just want to say a great THANKS to OKAMI Writer :
Wolfram Roesler <wr@bara.oche.de>
This is a great job !

1895. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1995-02-07 15:16:33 UTC
From: g.m.hockney@sussex.ac.uk
Message-ID: <g.m.hockney-0702951616330001@edbtech.central.susx.ac.uk>
Source record: 171940

I picked up a message that you are looking for a Spectre
GCR. I have same v3 for sale if you are still interested. I would like
£175.00 UK for it & also have a quantum 160Mb SCSI drive full of the
latest software. That would cost you another £100 UK.

> >I guess you're talking about marking bad sectors, right?
>
> No Claus, this is often refered to as a Disk Format, that will load
> faster, they have a bad sector at the end of the track...

Oh, that. Yes, this is described in my book as a tricky format
which can be created using a special interleave/number of sectors
combination in the Flopfmt() call. I didn't give it a name way
back then, though, but I may have been the first in Germany to
discover it. The trick is to write 11 sectors to the disk,
with the standard gaps between the sectors. The 11th sector will
not be completely written, but there's enough space for its
sector header. The boot sector, however, claims that there are
only 9 sectors per track.

To understand why this speeds up disk access, imagine what happens
if you load a big file, i.e. several full, successive tracks.
When the disk head moves to the next track, the controller normally
tries to verify that it has reached the correct track by reading
the next sector header that it finds on the current track. On a
standard non-twisted disk, this will be sector 1. After
verification, the next read command follows, i.e. BIOS tries
to read sectors 1 through 9 of the current track - starting with
sector 1. But sector 1 is already gone now, and we have to wait
a full revolution until we can start reading the track.

On a disk formatted as described above, the 11th sector's header
will be found when the controller tries to verify the track position,
and when the BIOS issues the track read command, sector 1 is
exactly the next sector - no time is lost.

Standard disk "Dead sectoring"
---
1) Position in track
after reading track n
vv vv
track n 1 [...] 7 8 9 1 [...] 7 8 9 10 11

2) Position in track
after seeking to track n+1

vv vv
track n+1 1 [...] 7 8 9 1 [...] 7 8 9 10 11

3) Position in track after
track verification

vv vv
track n+1 1 [...] 7 8 9 1 [...] 7 8 9 10 11

4) Position in track before
the track read command

vv vv
track n+1 1 [...] 7 8 9 1 [...] 7 8 9 10 11

There are some issues with this format, though. First of all, you cannot
create a fast 10-sector format using the standard Flopfmt() function.
Second, for some drives this may actually be *too* fast because the
heads will still be swinging when they arrive at the next track.
(I've seen such drives.)

From: vdleij@phil.ruu.nl
Message-ID: <vdleij-0702951722130001@ana-dyn-22.mac.phil.ruu.nl>
Source record: 171943

Press release:

At the Atari Show in Schiedam 18-2-1995 we will present and release the final version of PONG 2000, the commercial Falcon only game. It will feature 101 levels in 6 sectors in True Colour graphics with CD-quality sound. You can play PONG 2000, PONG DUEL and PONG Classic. Shortly after we will release a final demo version for PD libraries etc. We also have then a review version for magazines ready. Interested dealers and retailers can get their address in our ordering textfile. Just get in touch with us.

>Any help would be greatly appreciated . . .
>Thanx!

I am not familiar with the SupraMega kit, so I couldn't tell you whether or not it will work, but it sounds like a similar configuration to Ataris host adapter. But I have a good idea of what will work - an ICD adSCSI, adSCSI+, or Link2 adapter. Cable from your DMA port to the SLMC box, then to your adSCSI, then to your SCSI drive. With the Link2, which normally attachs to you DMA port, you mave have to hook it in to your SLMC box between the box and your SCSI drive as I am not sure that your SLM or SCSI will work if the Link2 is between the DMA port and your SLMC box. The adSCSI hookup is the one I use, as Link would not work for me as I could not disable the parity of my SCSI drives, and I purchased them before Link2 came out :-(- which does not need the parity disabled. Re: the Link2-DMA-SLMCbox question - check with ICD. Sounds like you got such a good deal on the SupraMegs kit that you didn't check out compatability 8^)
Maybe you can find someone to trade an adSCSI for you SupraMega!

Message-ID: <3h89cj$2em@newsbf02.news.aol.com>
Source record: 171942

> Was the Skyline CD ever released?

Yes. My copy arrived a few months ago. It was VERY disappointing. The front-end software didn't work properly and was obviously a beta of something the authors hope to turn into a useful product; the search engine was inadequate, and the contents in terms of files were unexceptional. It does have a nice collection of MOD files, and that's about it.

The software collection on the disk is a hodgepodge of old and new. Some of the software was very long in the tooth.

Source record: 171941

Pekka:

Your points regarding the Falcon's prowess as a musical computer are
well taken. I never claimed that the Falcon was bad at making music, etc.

In fact, I have a friend who owns his own recording studio and is very
disappointed with the PC in the control room. He wants a computer that
is adept at digital editing and easy to use. Because I used to own a
Falcon, I suggessted that he buy one since many of the local music
stores here still support Ataris and I'm well aware of the Falcon's
digital capabilities.

Still, my original point was that the Falcon's pricing is ridiculous for
what you get. Not every Falcon owner bought his/her machine for
making music - the machine had promising video enhancements as well.
Many, like myself got one because it promised to be better than the older
16bit STs at doing many things. Unfortunately, due to a variety of
circumstances the machine didn't deliver all that was promised.

PC's do stink at music applications but they are cheap and can do alot w/o
alot of hassle (at least if you're an experienced computer user). If something
breaks on my PC I can replace it for very little and get the parts I need
almost anywhere - even in this tiny hick town where I go to college.

Again, the Falcon is what the STe was intended to be and always should have
been, except that it doesn't (unfortunately) carry the STe's price.

Actually, the defaults must be saved in the form "UNITERM .SET" file. When
it asks where to save the defaults, type UNITERM <then hit "."> then type
SET. Notice the space after the word UNITERM. It is not obtained by
hitting the space bar, but by hitting "."

It would be nice to register, anyway, if he still has an available address.

Another common source is unZooing with a Zoo which screws around
with filenames so case isn't preserved. The X exec must be a
capital X and not a lowercase one. It is a good idea to print
out an archive listing and compare your directories to make
certain all case/lengths of filenames has been preserved!

1914. KA9Q Questions --

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 00:09:57 UTC
From: kerkhoff@mail.utexas.edu
Message-ID: <3h924l$8de@geraldo.cc.utexas.edu>
Source record: 171861

After reading the newsgroup for a while, I may be a little behind the times but I'll ask anyway. I'm interested in getting KA9Q (or some other software) functioning so I can connect with the 'net. I have a slip account with the University and I think I'm close to getting the NOS functioning. I have a couple of questions, though.

I downloaded the STNET110.TOS software and have done quite a bit of configuration on it. The dialer works, and I am (apparently) saying the right things to the system at UT to get a slip connection going. The BOOTP command doesn't appear to working in NOS, however. Here's an listing of what I'm doing:

```
#startup file for KA9Q-NOS (version .41)

log \nos\spool\nos.log

hostname s10

attach asy AUX: 0 slip s10 32767 1500 19200
dial s10 dial.txt

ifconfig s10 netmask 0xffff0000 broadcast 255.255.255.255
route add default s10
route add 255.255.255.255 s10

#here's the one that doesn't work---
#returns the error message "command not recognized"
bootp s10 noisy

ip ttl 64

#etc......
```

I suspect that I'm missing something obvious in the setup but the docs are truly daunting! Also, if I type the commands in manually line-by-line, I can watch them complete. When I set them up in the startup.nos file, the "dial" command is skipped and a number of errors are generated since "s10" hasn't been defined. "Dial.txt" contains my account and password as-well-as the lines:

```
terminal download
slip default
```

To which the UT machine responds with "Your IP address is..."

Has anyone configured NOS this way before? Any help would certainly be appreciated!

Well the typical user in the UK most certianly doesn't have a CD-ROM drive hung on the back of their ST. Most of them have 1Mb RAM, but thats about all. Hard drives are more common than they were - but still my no means universal. I think its fair to say that most CD-ROM drives are connected to hard disk host adaptors or are owned by hard disk owners. Taking these factors into account - its only a small percentage of users who have CD-ROM.

I know several people who do have a CD-ROM and *many* that don't. Most of the people I know have hard drives as well - so this isn't a fair sample of the market anyway.

Roland.

I still stand by my statement. Your group will not be a group of average Atari owners. For every 1 person you have with a CD-ROM, there will be dozens of Atari users not in the group who don't.

Out of the Atari users who use the CiX system in London - quite a few do have CD-ROMs, but this is not a group of average users either.

Roland.

Actually I meant 'connected to the Atari' as opposed to an Atari owner who
also has a PC or MAC CD-ROM drive to read CD-ROMs from.

> controllers etc. but a semi-made-for-atari one. Some exist, but the
> only CDs I've seen for the ST have been full of PD & Shareware stuff,

> already got all the good stuff.

But I agree with everything else you say.

I dare say that if we took a survey here that many people wouldn't have
an Atari based CD-ROM, and this is a pretty elite group anyway. Not many
people here without hard drives or 1Mb upgrades for starters.

:-)

1922. Re: Atari files read by Amiga/PC?

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 00:25:45 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <3h9329$37c$1@mhadf.production.compuserve.com>
Source record: 171864

The Atari ST uses almost exactly the same floppy disk format as the PC, so if you still have access to the ST you can transfer files to a PC with no additional software needed at all.

The "secret" is to format the floppy disk on the PC as a 720 K disk.

Then you can just write the files on it with the ST and read them directly on the PC.

The reason you need to format the disk on the PC is that some versions of the Atari operating system don't create a fully MS-DOS compatible disk.

The reason you need to be sure to format it as 720 K is that standard ST disk drives won't read or write High Density floppies.

IF YOU DON'T have access to an ST any longer, but still want to read ST disks that were formatted by an incompatible version of the Atari OS, there are a number of PC programs which will let you read the files. One is called ST2PC.EXE... It may be available on IBM ftp archives. I do know it's available on CompuServe.

Additionally you can use a disk sector editor to directly change the incorrect bytes in the floppy boot sector to make the disk readable by a PC, but that's a bit ticklish, especially if the disks are valuable.

Sorry.. I don't know squat about Amigas.. :)

That is to say, they are now all working happily in other people's
(non-Atari) computers. There hasn't been a local Atari dealer in my area
for about 4 or 5 years now, and I can't afford to spend any money on this
computer, anyway. I'll try again sometime later, when I get more money (I
just spent all my money buying a Mac).

Somebody mentioned that the power supply might be faulty. If so, what can I
do about it? Also, a couple people mentioned the MMU, but I think those who
did were unsure if the ST has one. Anyone know if it does?

Me far. You near.

Thanks. I got it from some site in the UK. I got version 2.0, which is from 1991. In the doc, they said that a goal was to sometime make it comply to the ANSI standard. Know if they ever got around to it? Also, what files do I need to use it? I got scbin20.lzh and sozodlib.arc. I didn't see anything else that looked relevant, yet with what's in those, I don't seem to be able to compile an extremely simple program. Also, if anyone reading this uses it: cc.ttp doesn't do crap for me. it can't find any of the other programs. I have 'em all in the same directory, which the doc says is okay. I have to use each program. It's not that bad, but kind of a pain.

May your cheez-wiz never grow feet

What's this?! Is this true? I mean, I know the ST, etc., series has never done considerably well, but Atari persisted for so long, I never thought they would actually give up on the computers. Assuming that it is true, will 3rd party hardware companies and software companies still support the system?

While I'm asking about it... How're the ST/TT/F030 doing in various countries? I thought they were doing okay a few years ago in some European countries.

Also, was there ever an 040 upgrade for any Atari computers? I assume they never made a Falcon040, or such. (I saw an article, again, recently, from 1992. In Jan., they were expecting an 040 system out by 1993. Heh:)

good night, a ding ding ding ding

Format your disks as 720k MSDOS disks using PC Exchange on the Mac.
Alternatively, if you have TOS 1.04 or later, you could format them on the ST
and the Mac should be able to read/write to them using PC Exchange, DOS
Mounter or a similar util. If you have earlier TOS you could use one of the
many PD and Shareware formatters available that write an MSDOS boot sector.

Yep, bat that was before Llamazap....

|> : I'm just getting into Llamazap now, Jeff!
|>
|> Are LlamaZap and Llamatron available for PC? If so, where could I find
|> them?

Llamatron is available for the PC, but I didn't think it was anywhere near as good. (Using keyboard limits the control severely due to only three keys at once...)

Llamazap is only available on the Falcon - it was comissioned by Atari I believe.

Never mind, you'll just have to get a Falcon :)

Anthony

BTW Can anyone get past "Continual Hassle" in Llamazap - Gridrunner the second time around....

No but I've had TIFFs which were generated on a Mac and which GEMview
could display but xv couldn't. Maybe GEMview is just better than xv?

And speaking of viewers: GEMview is an excellent swiss army knife of a
program, but the viewers which come with Apex Media are FAST. :>>

1941. Re: Network a TT030 with a Macintosh?

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 10:07:31 UTC
From: harun@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3ha553$onq@mars.fb1.fhtw-berlin.de>
Source record: 171892

The connector is mechanically the same as on Mac, but electrically is a small difference: The Mac has _no_ termination resitors, the TT has. (and this is bad, if you like to link more than two computers in the LocalTalk-way of linking it.)

I believe there is no (working) LocalTalk-Software for the Atari.

But I have two Ataris and one Mac in a Net via MIDI_COM. That is not LocalTalk and it is only running on the Mac, when MagiCMac runs on the Mac :-)

Regards, HS

1943. Re: Is Atari Alive???

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 10:12:56 UTC
From: harun@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3ha5f8$onq@mars.fb1.fhtw-berlin.de>
Source record: 171894

My impression: Atari still exists, but it develops only video games.
Falcons are still produced. But I can not recommend upgrading any
other 16/32-Bit Atari to a Falcon. If you need computing power and
if you have "clean" applications, by a 68040-Mac and run MagiCMac on it.
The Performa 475 has (in Germany) at the moment the best price/performance
ratio.

I tried to contact atari, but they didn't seem to care.
They sent my ste away to holland to fix the dma fault,
but it came back with the same fault, and a smashed case.
Screws were rattling about inside, and i had £270 worth
of useless hard drive kit (which Gasteiner luckily accepted
back, less cancellation fee).

So, don't contact atari over anything - they don't give a
toss about their customers..

This is a valid filename in Unix and VMS.

If you want to download it to a filesystem which only accepts 8+3 filenames then you need to tell ftp to

get cannon_fodder_cheat.prg canfodch.prg

or something like that -- RTFM for your ftp implementation.

I have a Supra Hard disk and it works fine.

I started with a 48 meg and am now running a 105 meg Quantum SCSI 1.
In the last few days I have found out the hard way that with the OLD
Supra SCSI to DMA adaptor in the drive, I can only use a SCSI 1 and NOT a
SCSI 2 drive like all of the new ones seem to be:-(

If you want to upgrade to a bigger size, (like I do) either get a SCSI 1
or a new ICD adaptor.
Regards,

Roger Sheppard.. (sheppard_r@ix.wcc.govt.nz) wrote:
: Can any please explain what was point of have a Atari WWW and Gopher
: that only UK people can use..

Well, we are a funded site...and according to our funders, the ac.uk users come first...providing them with a better service. We are not supposed to allow other users to use the system, but being the nice people we are, we thought we'd see how things went, by giving restricted access via ftp, and unrestricted via telnet/gopher/www.

The restrictions is placed on us by our funders. Don't ask me to comment more on this, as I will have to pass with 'no comment'...seeing as I am representing them ATM.

Please bear in mind that I do not have to think like them, even if I don't say so here. But that is for you to work out.

: Does this affect all other Computer users or Just Atari ones..??
All computer users.

: All the raving in the last few weeks regarding the Atari Web pages,
: to me this just stinks...
hey, I did not know this was gonna happen. No one did. However, would you prefer a dead machine to a live one? If the restrictions were not placed, it would have been goodbye HENSA, till our budgets allowed us to buy another machine. I am sure you would not like that.

Who knows, maybe there will be gopher and www access in the near future. I don't know.

: To me Danny you might as well close the Atari section for good, if you can't
: support the world what is the point...

My job''s primary objective is to support the ac.uk users....and for my section specifically, the Atari and mac users in the ac.uk. It's a different matter, however, that there are not that many people in the uk who have Ataris.....which is my main concern right now, as most of the Atari logins were from abroad.

I will definitely not close the Atari section. No way. It has taken me so long to bring it up to what it is. Do you know that the Atari section here stank before I arrived here? I never even used it in the time I was on the net. It just was not worth it. When I got the job, my main concern was to get the section going again. The last new piece of software that wrnt on-line was a year before that. That just plain stinks....and now you tell me to shut the section....after so much hard work? If you do not like HENSA, then why d you use it?

Actually, I know you like hensa, it's the fact that you can't access it directly...

FWIW, I would like to see no restrictions at all. That is my personal view in Danny clothing (with all the HENSA insights)....not in HENSA clothing.

: Atari Hensa R.I.P.....
This is going too far, Roger.

: it will not be International in what Hensa is doing, or should Hensa
: be removed fron Internet....??
Why should it be removed from the internet? You can think of HENSA as a subscriber only BBS, where people who subscribe to the Janet network, can gain access....unless you can think of a way of coming through a Janet address....

: Time to buy that PC Clone so I can get better suport...!!!

So what I have been doing has been worthless?
[FX...Danny walks off, sulking, and thinking where he went wrong, and totally hurt by Roger's comments]

: while systems are upgraded before flaming them so much that they _are_

The system is not being upgraded. :-(But please be patient. As I have
said, there are other ways of getting in...and if you see another of
Roger's posts about gopher, you will see what I mean.

Regards
danny

Hmmm. Best to now download every possible useful file! Still
ftp 146.169.43.1 will still be online - a mirror site containing atari
stuff; I get most of my files from here. I find Hensa a tad slow anyway.

1961. (Req) SCSI Conroller?

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 13:21:58 UTC
From: starkrl@aston.ac.uk
Message-ID: <D3onsn.Cnx@aston.ac.uk>
Source record: 171899

Hi there,

Is anybody out there selling a SCSI controller of any kind?

From what I've seen, the Top Link controller is pretty good, as it consists of simply a cable to go between the atari and hard drive with a bit of circuitry in one end of the lead, and it apparently works well.
The only thing is, I can't believe how expensive they are! (I haven't found one for cheaper than 55 quid so far, although I'm yet to phone The Upgrade Shop which may be cheaper)

So, if anyone can enlighten me on this subject, or even better, if anyone is selling a controller, then please reply (either to comp.sys.atari.st or to me at starkrl@aston.ac.uk).

Thanks!

ROB.

P.S. I've got a 1MB STFM and will soon have a 260MB SCSI drive!
I hope it all works OK....

Denesh Bhabuta (vctec@westminster.ac.uk) wrote:
: No restrictions were posted in the Amiga or other groups, because their
: moderators do not really bother with usenet postings, and are not as
: active as me on Usenet. Have you seen file postings in the other
: groups, from HENSA?

From here, it looks as if all of the HENSA/Micros archive is now restricted - according to the (no longer working) link from HENSA/Unix, this includes Commodore Amiga, Acorn Archimedes, Atari ST, IBM PC and compatibles, and Apple Macintosh. I can also confirm that the restriction is to ac.uk and *not* uk - we in co.uk are excluded too :-(

: As I have already said elsewhere...if it was up to me, then there would
: be no restrictions....but it is not. Maybe a new ftp site shpould open
: up....

Is there any chance of getting "SunSITE Northern Europe" to mirror the archive - being at src.doc.ic.ac.uk they can get to you easily, and they already mirror the Atari archives at umich and uni-paderborn.

> >So how do I get executables from the Mac onto the ST? I got some uuencoded
> >files which decoded (on the Mac) into zip files...where do I go from here?
>
OK troops, here's my (actually your) solution:

I was ftp'ing files onto a Sun, then using Fetch to move them to my mac.
Fetch in automatic mode made everything into a Microsoft Word file (it
shouldn't but it did). Once I forced Fetch to binary mode and picked up
starter.tos I had no more problems...this will help me keep the old ST
going for a while longer...

Thanks again for all the advice and suggestions...I had dozens of people
respond to me privately and many more on the newsgroup. You're an
impressive bunch...the type of people who got me into Ataris in the first
place.

Hi. I used to own SunDog and remembered that the manual that came w/the game was basically just there to show you how the game works. Half of the pages were used to describe how to get the game started on TOS boot-disk systems (yes, the game is way old!).

In short, its not needed to play the game as all control is done with the mouse and the manual gives you no serious hints on how to succeed at the game.

BTW, the game runs on the STe (1040STe) and ran on my Falcon w/Backwards.

Here is my top 10 list of the best games for the ST.
They are in no particular order.

1) Kick Off II
2) Powermonger
3) Player Manager
4) Frontier Elite II
5) Supercars II
6) Civilization
7) Populous II
8) Thunderhawk
9) IK+
10) Sensible Soccer

What do you think of my list?
It was created off the top of my head so I have probably left some
out. Don't flame me.

Source record: 171804

As I mentioned before, Llamatron for the PC is virtually identical to the ST version! The gfx are the same, the screen effects are the same, and the sound is largely the same if you have a SB or better. The only difference is that it runs on an Intel based system and that it supports the keyboard on the PC AS WELL as joysticks. Joysticks aren't as common with PC users than with Ataris so the keyboard option was added.

Oh yeah...as for the best ST games...add these to the list:

* Their Finest Hour (if run on a fast ST - 16mhz or better)
* Spider Tronic
* Speedball
* Deluxe Asteroids
* Midi Maze
* Gods
* Andies Attack (another Minter Production)
* Defender of the Crown (loved the catapult scenes)
* Kid Kong (Dave Munsie's exact clone of Donkey Kong)
* Flight Simulator
* Major Motion

Errm, do you mean the source is at Clausthal? If the binary were there, your problems were _almost_ solved.

However, it is not legal to re-import certain versions of PGP back into the united states.

The US-versions use a RSA-licensed library, which is not to be exported. The international version does not use RSA directly, and can be used legally outside the US. But the import of this non-RSA-version into the US is restricted.

>to use one, I'm hoping someone has already done it. I would be grateful,
>to be able to download it.

There are several Atari-version around, I'm using it for sometime now. Perhaps you can find an appropriate version somwehere at *atari.archive.umich.edu*.

Ummm... just becuase ST Format say something does not mean it is true. In fact the opposite is quite often true. Anyway, I guess the guys at ST Format probably got the rumour off the 'net like we did, confirmed the existence of a C-Lab machine and then just made the rest up...

Not that I have a lack of respect for the facts presented in ST Format, oh no :)

>==

This is, of course, a personal decision. I'll tell you my decision.
Atari has, according to rumours/facts(depending on who you believe:^), "abandoned" the Computer field. Why do I continue to use Atari products therefore?

1)I have software that does what I need it to do (CalamusSL, Cubase, Das Repro,etc)that is state of the art. (I work in the graphics field, using MAC and Windoze/OS/2 software [CorelDRAW, Illustrator, Photoshop, Quark] on a daily basis in my full-time jo
2)I have support, my local users group, the Net, Dealers,programmers.
3)The Atari market is not "growing" - Falcons and TT's are still being sold, just not in the same quantities as MACS for example BUT neither is it shrinking 4)3rd parties are expanding the field - the "Medusa" and the "Eagle" from Germany, and the C-Lab

It depends on what you want to do and what you do do with your computer. If you want to just write, any computer will do that, same with spreadsheets, databases, etc. for MIDI Atari can't be beat price wise. Graphics software for the Atari is unknown by e

We often feel at the mercy of "market forces", advertising hype take its toll, peer pressure is not something to which even I am immune, but I will not throw away great software, skills and abilities just to hop on the "bandwagon" File format compatibilty

So there you have it. My decision and why. As to upgrading, it depends on what you have. I'd say get a Falcon instead of upgrading, but it all depends on what you want to do

Yes, definately!

> Apparently, speeds of up to 115000bps are possible
> with a little hardware upgrade.

No need for hardware-hacks on the Falcon. To get more than 19k2 on a
ST, MegaST or STE will however require a small HW-hack.

> *A software patch would be ideal* I'm looking for 38400, or 57000bps......

No problems at all. Just get a file called HSMODA05.LZH and follow
the instructions. It will replace the current serial drivers with new
bug-free ones and will let you run at up to 115Kbps.

No, there are no such packages available that I am aware of. I _guess_
this is because a very large part of the MacOS would need to be
"copied" in such a package in order to make it run. AFAIK the AppleTalk-
protocol is rather complex and it would be hard to implement it on top
of TOS due to the fact that TOS lacks many of the features MacOS has.

I would recommend you to install Linux68k on your box instead of MiNT
if X-Window is what you want to run. X for MiNT currently only works
in mono and since MiNT doesn`t support VM you will probably run short
on memory even with 14MB.

As for what you need, I know someone is preparing a FAQ on the subject.
Just wait and see...

Hi Folks!

MultiTOS supports some Ctrl-Alt-Keys I know about Ctrl-Alt-Tab for
switching application?

Are there other Key strokes? Especially one for switching tofrom
APPLICATIONS to ACCESORIES???

Thenaks for an answer!

Ciao, Arnt

It shouldn`t give you any problems. However, you will not be able
to make much use of the multitasking with only 1MB.

BZZZZZZZZT. Wrong answer.

Hyperdrive equipped Macintosh computers can format and write a DOS-compatible
HD disk, but _not_ DD disks.

1985. FS: 1040ST w/ 2meg, mono & color monitors, 204(?) HD shoebox

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 18:06:44 UTC
From: pickle@nocturne.cs.ucla.edu
Message-ID: <3hb17k$q1i@nocturne.cs.ucla.edu>
Source record: 171811

Howdy--I've got an old 1040ST with an Atari-certified-chimpanzee
installed 1 meg upgrade board (thus, 2megs) that I'd like to sell
or donate. The floppy drive interface is flaky: I had swapped in
a new drive (and had to hack the case), but the problems didn't go
away, so I think it's something on the motherboard. Other than
the floppy, I think it's ok.

Also, I've got one each color and mono monitor, and an Atari
hard disk shoebox (I think it's a model 204; originally came with
20 meg?) but the disk has been removed.

It's been sitting in my closet for a couple of years, and it's time
for it to go. If anyone has use for it, and will offer something on
the order of shipping costs + an incentive for me to take it to the
post office, you can have it.... If there's an LA area charity that
would like it, I'd be happy to cart it over to them.

Send me email if you're interested.

Thanks,

Patrick H. Madden

1987. is atari alive? repost

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 18:22:45 UTC
From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.150.000D6183@cfcsc.dnd.ca>
Source record: 171756

I decided to repost this as my first post got mangled beyond recognition.
Actually this properly belongs in comp.sys.atari.advocacy, right :^)
This is, of course, a personal decision. I'll tell you my decision.
Atari has, according to rumours/facts(depending on who you believe:^),
"abandoned" the Computer field. Why do I continue to use Atari products
therefore?
1)I have software that does what I need it to do (CalamusSL, Cubase, Das Repro,
etc) that is state of the art. (I work in the graphics field, using MAC and
Windoze/OS/2 software [CorelDRAW, Illustrator, Photoshop, Quark] on a daily
basis in my full-time job. I freelance using my Atari at home running
graphics/DTP software and I KNOW it is as good as the other stuff, especially
das repro vs Photoshop!
2)I have support, my local users group, the Net, Dealers,programmers.
3)The Atari market is not "growing" - Falcons and TT's are still being sold,
just not in the same quantities as MACS for example BUT neither is it
shrinking
4)3rd parties are expanding the field - the "Medusa" and the "Eagle"
from Germany, and the C-Lab machine for MIDI are *NEW* explorations of the
Atari hardware scene. Someone thinks there is money to be made still.

It depends on what you want to do and what you do do with your computer.
If you want to just write, any computer will do that, same with spreadsheets,
databases, etc. for MIDI Atari can't be beat price wise. Graphics software for
the Atari is unknown by even graphics pro this side of the pond, but it is top
knotch. Video work? an amiga is the only low end station I've seen, though
I've heard of some good Video prg coming out now for the Atari able to use the
Falcons hardware.

We often feel at the mercy of "market forces", advertising hype take its toll, peer
pressure is not something to which even I am immune, but I will not throw away
great software, skills and abilities just to hop on the "bandwagon" File
format compatibilty is NOT an issue, I've never experienced those problems. An
postscript file is a postscript file whether produced on a MAC, Atari, or IBM.

So there you have it. My decision and why. As to upgrading, it depends on what
you have. I'd say get a Falcon instead of upgrading, but it all depends on
what you want to do
plus tard/later

The Atari A to Z book
by Mark S Baines

Jargon, terminology and acronyms are the staple diet of any professional, technologist and hobbyist. The world of computing is no exception and to the uninitiated home or small business user, magazines, manuals and books can be very daunting. Written by someone who understands these frustrations and needs, "The Atari A to Z" is an encyclopaedia of modern computer terminology specifically pertaining to Atari computers.

Whether you play games on an ST, run your business on a TT or write music on a Falcon, this book is aimed at helping you get to grips with magazines and books that are more perplexing than enlightening. In it, you will find definitions, explanations, mini-articles, tables and lists to help you gain a better understanding of your Atari computer. The material in this book was written with all Atari users in mind. There are simple definitions for the uninitiated and technical data for the experienced. You take what you want, when you want it. "The Atari A to Z" is an invaluable addition to any Atari user's library.

The Book
"The Atari A to Z" is a high quality book, produced in A5 format, 340 pages long and comb bound for convenience. It contains 2,238 entries, 101 tables and 128,000 words. There are 5 appendices - Addresses, Book List, Connectors, Extensions, Atari ASCII set, ANSI Character Set.

Firstly, this is a comprehensive general computing dictionary, there being entries for all the common terms and acronyms found in modern day computing. Like any computer user, Atari users require help with terms not specific to their particular machine. They should be able to find what they want here.

Secondly, there are entries of Atari-related terms and acronyms which cover all the Atari computers and consoles. There are expanded explanations and essays, tables and lists which together form a comprehensive inventory of material that "The Atari Compendium" left out and not found elsewhere. The table of System Variables is more accurate than that in "The Atari Compendium". There is a list of Exception Vectors, Atari Cookies and their meanings, Memory Maps for all Atari computers (and more accurate than that in "The Atari Compendium"), a full Breakdown of the DESKTOP.INF and NEWDESK.INF files (not found in ANY other publication), Errors Messages and Bombs, Pin Connections of all the ports on all the machines, Technical Specifications of the whole Atari range, a Breakdown of the TOS Versions and the differences between them, an explanation of GDOS, MultiTOS, the VT52 emulator and codes, all the main chips, viruses, a light-hearted look at computer laws, a list of common file extenders and their meanings, a list of contact addresses, a bibliography... this is just a *little* taster of some

of the important aspects of this book. "The Atari A to Z" is thorough!

The Author
Mark S Baines is a highly experienced computer user having bought his first computer in 1982, been on the communications networks since 1983 and the Internet since 1993. Holding Bachelor and Masters degrees, Mark was once a secondary school teacher of Biology, Computer Studies and Information Technology, a network manager and school administrator. He left the profession after 12 years to move to his beloved Highlands to pursue a more benign lifestyle. He currently runs Linnhe Computing, carrying out training, consultancy, freelance writing and journalism and anything else that takes his fancy. Mark has written regular columns and other articles in various magazines for several years, including more recently ST Applications and ST Review.

Availability
The book is only available from:

Linnhe Computing
Linnhe, Shore Street
Inver, by Tain
Ross-shire
UK
IV20 1SF

Price
UK
The cost is a very reasonable £10.99 including postage and package.
Payment is by Cash, Cheques (drawn on UK banks only) and Postal Orders only.
Cheques must be made out to "Mark S Baines".

Europe
Add £1.00 postage - total £11.99

US and Canada
Add £2.75 postage - total £13.74

Australia
Add £3.40 postage - total £14.39

PLEASE NOTE: Only UK cash, cheques and postal orders (available in Canada and Australia) are accepted. DO NOT send anything else!

Mark

1989. Draft FAQ: How to install MiNT and friends (was Re: MiNT, etc...)

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 18:51:41 UTC
From: cpbs@ukc.ac.uk
Message-ID: <11842@gos.ukc.ac.uk>
Source record: 171831
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

[Note: Followups are directed to comp.sys.atari.st only]

In article <791779302snz@bassland.demon.co.uk>,
Simon Williams <simon@bassland.demon.co.uk> wrote:
>? "Wouldn't it be nice if at least one person actually sat down and wrote a
>complete guide, to setting up MiNT/Minix/Lynx, etc" - I know I'm not the
>only person who needs to know.

I accept your challenge! Below is my outline of a possible "How to
Install MiNT" document.

I would appreciate comments. Particularly, I have experience of
setting up MiNT on only one system -- my own. Please mail me about
your system, giving details of what hardware and software you have, any
problems you encountered and how you solved them (if you have solved
them!) I will try to look for patterns, and add the details to the
FAQ.

I will fill in as much as I know or have experience of in the next few
days, and add anything of relevance that I receive in e-mail or read on
Usenet. I can't, however, guarantee that I'll see items posted here;
if you want it in this document mail it to me directly. My e-mail
address is in the header of this posting.

I will try to keep the names of authors attached to the information
they've submitted, but if this becomes impractical, I'll just put all
the names in one big lump at the end.

I expect to have a useful amount of information in this document in
about a week's time, and will post it again then, and whenever there is
a substantial amount of new information. I welcome suggestions as to
how often it should be posted when it has reached a stable state.

I have tried to include the questions that are often asked here, and
topics that are likely to be asked. However, if there is a topic that
you feel should or shouldn't be covered in this document, let me know
about that, too.

Thank you all for your help!

> to a Falcon.

The Epson GT-6500 and 8000 work with the Falcon. I got mine from CGS
Computerbild in London. The 8000 has both SCSI and parallel connection,
the 6500 has a choice of one or the other. They recommended the parallel,
as they've had troubles with the SCSI interface.

Also Migraph in the USA are supposed to be bringing out a flatbed scanner
for the Falcon. Don't know if it exists yet, but they have it in their
catalogue.

1991. MiNT 1.12 - Baud Rate Settings?

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 19:30:26 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <D3p4uq.407@watserv2.uwaterloo.ca>
Source record: 171819
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been trying to set the baud rate of my PPP connection
using pppd on a TT/serial2/HSMOD05 to 57600. Mint runs
after the HSMOD stuff and pppd sazs 57600 not supported.
If I try 134 (remapped value for 57600) i get a 19200
connection. 38400 is accepted as a baud rate

I tried running HSMOD stuff after Mint (and in various combos)
but pppd complains 'tcgetattr: invalid function number' This
tells me Mint must have some routines that are overwritten
bz HSMOD05 that are necessary. Does anzone know how to get
Mint to accept 57600?

It makes me wonder how musch HSMOD actually does if run before Mint.
I tried running DRVIN before mint and SCC after. SCC complained
the RSVF cookie was not found. Does Mint screw up the cookie jar?

Thanks,
Sam

All the above lines which currently say s10 should read sl0.

I'll have a look through my startup file later and see what the differences
are.

I've been using the same set of extenders for about two years! There again,
I don't play that many games since my daughter got married. (She was hell on
joysticks - broke four)

I bought them at "System 2000" in Nottingham ,which is probably the least
useful information to you. If I remember correctly they were made by
"Lightwave" (or similar) who do all sorts of leads and extenders for all
sorts of platforms.

BTW the ones I'm talking about are the 9" or so long ones designed to save
the ports from damage. If you want the gianormous things so's you can play
from the other side of the park, then I think Tandy are your best bet

Best of luck

WRONG...!!!!

You still need the RSVE hardware mod on a ST/STE Mega ST, their is
no other way to get faster speeds, you need to clock the MPF faster
that meens a faster clock, this is what the RSVE mod does......

V > of a shareware program of mine, but it ended there...Anybody
V > know more about this?

yes, it did - as a matter of fact, I picked it up around the
middle of December from a local Atari shop. It's a great resource of
Atari-related stuff and other things (like tons of .FLI and .MOD
files). The only bad thing about it is the navigation
software/database - it just doesn't work.

Cybercube Research is handling distribution in North America.

We're looking forward to CGS Computerbild's presence
too, as well as COMPO, Migraph, C-LAB, Wizztronics,
Best Electronics and *many* more!!

=-=-=-=-=-=- This will be the premier Atari show of the '90s

=-=-=-=-=-=- User Groups from all over North America are attending

=-=-=-=-=-=- Continuous Seminars and Lectures

=-=-=-=-=-=- The ACE'95 Creativity Contest

=-=-=-=-=-=- Need something? It will be on sale at ACE'95

=-=-=-=-=-=- The BEST dealers and developers will be there

=-=-=-=-=-=- DMC Publishing, Beamscope, Lexicor, ABC Solutions,
Atari & several others, are providing an
unbelievable lineup of door prizes, creativity
contest prizes and the ACE'95 Grand Prize

=-=-=-=-=-=- MIDI, DTP, Wordprocessing, Graphics, Power
Computing, Accelerators, Emulators, Jaguar Stations,
User Group Center, INCREDIBLE SALE PRICES,
Software, Hardware

=-=-=-=-=-=- More Atari users in one place than is really safe =;^)

==========
Getting to ACE'95 is *easy*. Toronto is directly

accessed by Highway 401 or the Queen Elizabeth Way, or Highway 400/69. Crossing the US/Canada border at Detroit, Buffalo, Niagara Falls, Ft. Erie, Ogdensburg, Kingston, etc. will lead you directly to Highway 401 or the Queen Elizabeth Way. Take the Yonge St. Ramp north off the 401 and drive to 5110 Yonge St. If you take the Queen Elizabeth Way, follow the signs to get to highway 401. *ANY* AAA or CAA or other Motor League can provide you with a map of Toronto, Ontario & Canada. Please call us if you have any trouble! Pearson International Airport is only 15 minutes away! Toronto Transit subway access is direct, too - there's a subway stop at the Civic Center!

==========

Book your tickets in advance! Book your hotel in advance! Call or e-mail for a Show Kit: for your User Group or organization or group! The Show site (North York Civic Center, Memorial Hall Exhibition Facility) has hotel, shoppping, restaurants and more! NOVOTEL: $89 Cdn PER NIGHT
ACE'95 TICKETS: $6 PER DAY
$10 WEEKEND PASS

==========

Meet Dan Wilga, Darek Mihocka, Bob Luneski, Peter Zalesak, John Trautschold, Craig Harvey, Nathan Potechin, Mario Georgiou, Greg Kopchak, Al Fasoldt, Rick Ladage, Jim Fouch, David & Jennifer Troy, Michael Burkley, Roger Burrows, DARLAH, Craig Carmichael, Tom Harker, Chris Krowchuck, Jim Collins, Ralf Dowich, Shawn Tedder, Mike Wilhelm and plenty more of the greatest dealers, developers & supporters Atari users have ever seen!

==========

CALL US 416-225-5823 or 416-752-2744 *CALL US*

ACE'95 is being held at:
North York Civic Center
Memorial Hall Exhibition Facility
5110 Yonge St. (at Parkhome Ave.)
Toronto
April 1-2, 1995
Saturday 9AM - 6PM
Sunday 9AM - 5PM

~~ Howard Carson, ACE'95 Chief Organizer ~~~

2003. Problem downloading in "connect"

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 22:43:22 UTC
From: hallvart@oslonett.no
Message-ID: <3hbhea$q94@hasle.oslonett.no>
Source record: 171758

I have experienced problems downloading data with Zmodem in "Connect".
I've sued it a lot transferring small text files and zipped programs, and
that works fine despite my slow (2400) modem.
But when I try to get bigger files, like 40Kbytes or something it *seems*
like everything is fine. No errors or anything, but after the job is done
and I check, I only get a small file with that name, with a size of 800
bytes or something! Why is this? What have i done wrong?
Is it because of my slow modem?
Please reply via email.

Hallvard, oslo, Norway

Welcome to the madhouse.
You got it right. Special software - a Web browser - is required. Lynx, which
is text only, is, I understand, available; I have also heard that a couple
of graphical browsers are under development. As and when anything definitive
appears, I'd like to know too!

Would you like to tell me what's right with it? It may be acceptable to all
of you with Unix, Minix, Mint and all the other exotic stuff, but to poor
sods like me who actually USE an ST for net access, it's totally bloody
useless.
For once I agree with Roger. If you are going to post files for an ST, at
least the filename should be accessible by the machine!

It does work perfectly well with older versions as well.

> It is a little bit difficult to install because of the directories it
> needs to create. You need to run it in monochrome (I have a TV so I use

Granted, that is a limitation.

> 640x200 mono, configured with Bootconf from Uwe Seimet (Is it available
> on FTP ? I don't know).

You have to run it in mono, but why at 640*200? I'm running it on an
SVGA monitor at better than 800*600.

> A thing you must know is that it configures
> the Falcon's Keyboard in QWERTZ (deutsche thing !)

But you can change an X terminals key map using the xmodmap program.
I've written a short script for this that remaps the keyboard to
UK standard QWERTY & puts all the shift chars in the right place.

Run it at boot time & forget it, it takes no extra memory.

>It is really a pain
> when you type commands with a font 5x7 (the only font given with X11 for
> Mint+MintNet).

But you can use any X11 font, so there are hundreds free to download.

>It requires a lot of memory to run. 4megs is really just.
> I don't manage to get Outside running under Mint, and I can just run
> TWM , a, xterm , the xclock or the xeyes.

This is a problem, but xvt helps by using a lot less mem than Xterm.

> Also I didn't manage to get TWM running automatically at
> the boot time.

That's just you being crap :)
You should put twm in your .xinitrc file (but not first, due to a
quirk in the atari version - try running an xvt first then twm
as it makes twm work much better).

> Well, it could be something good that X for Mint uses the
> VDI for screen output.

I think because of the way X11 works you would find it almost impossible
to do a straight port & still use the VDI. You would end up having to
rewrite much of it (and it is a massive job).

> If someone could say me where to get X11R5 sources, I would be pleased
> to build a good version, who also uses it to scan the keyboard and use

MiNT-X is already a good version if you know how to use X, but
the sources are at src.doc.ic.ac.uk if you are a glutton for punishment.

> the GDOS fonts for output when available.

Don't do that - X already has it's own font standards (in fact, X11R5
comes with the same Speedo font technology as SpeedoGDOS anyway).

> Patrice Mandin
> i2a06a@iut-nantes.univ-nantes.fr

Oh - I see, he was french ;)

Craig.

2008. Re: What are the best games for the ST?

Newsgroup: comp.sys.atari.st
Date: 1995-02-08 23:24:42 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <3hbjrqiqh2@mhade.production.compuserve.com>
Source record: 171833
Cross-posted to: comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic

Peter Hofman sez:

Why would you want anyone to post to the wrong newsgroup..?

BobR
>could you please move this games-shit to rec.games.video.atari????

could you please move your inappropriate-shit to wherever it belongs????

The games being discussed are *Atari ST* games.. this is comp.sys.atari.st

Games discussed in rec.games.video.atari are games for Atari video games
systems like the 5200 and Jaguar.

> "Networks are Us!"
>
Look, you've got this a bit ass-backwards; one of your problems is that you
are confusing various terms.
"domain name" is that bit of your e-address that comes after the "@"
"username" is the bit before the "@"
IP address is the four number address which the net uses to identify you -
mine f'r instance is 152.158.93.65 You MUST have this to get anywhere ,this
is why the server tries to give it to you when you log on. Log on without
NOS and get your IP address before you try much else.

Much of the rest is parameters for the PPP connection. I suggest you ftp to
ftp.demon.co.uk and in the /pub/doc/atari directory you will find a set of
documents to help - you may already have them.

Bazza

On mine, the plastic hole don't quite line up with the metal sheaths
inside. Result: jam the suckers into the ports while hoping you don't
push it out the other side.

I know this - I have two sets! Go figure... <g>

You will have to rename it when you download it! Just give it some decent eight_char name when the filebox appears.

What? No filebox???? Get "uniterm" It's all I know so i can't recommend anything else. OK?

Yep, i'm sorry but my message was alot misleading. I meant you can use
software allright, but when running hardware you still need software as
well.

Hope this clear it up some more.

Atari used some crappy 6 ms steping drives and the Atari outputs 3 ms,
so that is the reason for that CPU board..

You have to remove all the IC's and add a few links, also connect the Side
Select line (Pins 2-32) that only runs to a dead end on that PCB, its trickey,
you need the info on the Drive pins and the 14 way connector, but you will
find most are connected...

Do you have a meter or a buzzer that you can check the pins out with...

2018. This is how to fix Mint X keyboard map!

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 06:33:06 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <D3pzJ7.A87@watserv2.uwaterloo.ca>
Source record: 171759

I"ve finally figured it out. The solution to the keyboard mapping
problem for english keyboards with MintX is quite simple.

Instructions to remap Mint X server keyboard to English:

1. ftp phlem.ph.kcl.ac.uk - get /pub/MiNT/X11/clients/client2.tar.gz
2. extract above archive and put xmodmap exec in a directory in PATH
3. cut the text at the end of this message and put in a file called
/etc/keymap (it doesn"t already exist, this is a name I chose)
4. edit .xinitrc - make the first line: 'xmodmap /etc/keymap' (no quotes)
5. reboot - the keyboard should be remapped

Notes:

The del and backspace seem to be the same - I don"t know the scancode
for del. The keypad period has the Xkeysym 'KP_separator' which turns
out to be a comma (I guess that's pretty European). It can be forced to
a period if desired.

Caps lock doesn"t work - again I don"t know the scancode (I figured
out most of them from 'xmodmap -pke')

I still don"t know what Ins, help, undo, clr home should be mapped to,
anyone who knows please send me any updates to the keymap file.

Enjoy being able to type again! (notice my proper y"s and z"s this time)

Sam

---------cut here ---------

I like Armour Geddon - Good 3d arcade-strategy-simulation - a little too hard, but best overall IMHO. Carrier Command is similar, but easier to survive. Both should be studied by all game designers for good user interface and fast 3d frame rate.

>> could you please mail me the details.

Like Bazza and (probably) many other people I too have had trouble with
siblings and Joysticks. I got my self some extenders from STR (RIP). They only
lasted about 3 months and I vowed _NEVER_ to get extenders again. Trouble or
what!!! Instead I got a pair of plugs and sockets and some ribbon cable from
Maplin (UK supplier) and installed them on the back of the machine just above
the Modem port. This was shown in an STR/STF article. (i cant remember which)
Its very easy to do and just requires you to be able to wield a soldering iron
(_NO_ soldering inside the machine) and a cut hole(s) in the ST.
Piece of cake and much better than grovelling underneath to plug JS/M in.
This has been in use now for about 1+ years and works very well esp' if you
have printer/hdd/modem/power/tv/monitor(soon) etc etc plugged into the back
you dont want to lift it all up to get to the sockets.

Give it a try you wont regret it

> It could be useful for getting stated in Authoring HTML. Just a thought.

Yup, it will definitely help me, as right now I just use Everest and have to take an educated guess as to the final result.

I've just had a look at ST-Guide, as it happens, and it looks very easy to use, and handy too (eg I can have local links).

Does everyone use ST-Guide? I might go for the 1st Word -> HTML -> ST-Guide combination.

Update: Now have and working! Some way to go tho'... (formatting et al...)

Cheers, Leon.

2027. <ad> GUARANTEED CREDIT REPAIR BY LAW FIRM

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 10:07:00 UTC
From: ccapc@cyber.sell.com
Message-ID: <3hcpg4$i0r@panix.com>
Source record: 171773

Consumer Credit Advocates, PC
11 Pennsylvania Plaza, Suite 2101
New York, NY 10001
(212) 629-5261 (telephone) (212) 629-4762 (fax)
E-MAIL: ccapc@cyber.sell.com

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

2032. Re : ST games decline. Producers fault?

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 10:44:28 UTC
From: "C.J.Davis" <daviscj@ee.port.ac.uk>
Message-ID: <3hcrmc$bh5@hawk.ee.port.ac.uk>
Source record: 171777

I know this subject has been discussed lots of times before but I must air my views before I die of frustration.

It is of my opinion that the reason for the decline in ST games is due soley to the games producers. I have spent many hours arguing with AMIGA (don't mention that word) owners about games on the ST. Amiga owners all think their machine is better because, i'll have to admit this, the games are better. I must aggree with them about the games though. The graphics seem to be about equal on both machines but the sound fx and the music is so much better (for most games) on the Amiga.

This is partly Atari's fault for putting that crap spectrum sound chip in their machines but it is mostly the producers fault who insist on using this chip in their games, who actually believe it can produce some decent sounds. I don't know about you but I just cannot believe that they are so stupid. Now I know games are meant to be centred around playability, but when the playability is coupled with dencent sound fx and a pumping backing tune then it makes the game a whole lot better to play.

This is why people stopped buying games for the ST. This is why it is so hard to find an ST game these days. Everyone knows the ST is a much better machine than the Amiga. It is just down to the fact that the sound effects and music on the Amiga games are samples, which makes the game sound a lot better.

Let's just look at some of the top selling titles for the ST shall we.

1) Kick Off 2 - uses samples
2) Sensible soccer - uses samples
3) Powermonger - uses samples
4) Populous I and II - both use samples
5) Thunderhawk - uses samples
etc...

All the best sellers are games which use samples. Although a lot have sold down to their playability. E.g Civilization, Midwinter II, etc... These type of games don't really need a lot of sound fx though.

The best thing Atari could of done was to never of put that bloody chip in their machine in the first place and I would have laid a bet that the ST would have been just as, if not more popular than the Amiga for games.

Please feel free to send in your thoughts on the matter.

I must apologise for using that word so many times in this article.
You know the one (Amoeba - ooopsss Amiga).

Roger Sheppard.. (sheppard_r@kosmos.wcc.govt.nz) wrote:
: Can the HP Laser Jet 4L be used with the Atari..??

Yup. I have had one for nearly two years now, and am very pleased with it.

: If so what are your thoughts on this Printer and what software supports it...

There is software that supports it...Timeworks 2 via FontGDOS does it very nicely. The timeworks drivers are fine too. Papyrus, NVDI, Speedo....and that is all you will need, as any program worth it's weight will use either NVDI drivers, or a variation of GDOS. Calamus prints out fine too, in LaserJet mode....and so does Pagestream.

The laserJet 4L doesn't come with any buttons to switch the internal fonts, or the amount of toner you want to print with (draft, right through to NLQ). However, I support a shareware program (CPX) which allows you to do this. very powerful program it is too, for controlling the printer...with the ability to save different defaults. This program is available at HENSA in tos/n096...and is in German. Registration brings you the English version.

Hope this helps...It is a very nice printer.

2037. PD Games..

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 11:34:58 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3hcul2$8i8@golem.wcc.govt.nz>
Source record: 171783

Well due to a Hardware problem on my Mega ST I lost a lot of
my PD games on the Hard Disk, well I think I have fixed it now touch wood..

I did a blanket resolder of all the Connections to do with the Hard Disk,
this is a internal one, I even replaced the ICD Micro Host, cables etc,
and resoldered all dry joints in the PSU, but then it would work for a few days
that start getting bootup problems and random crashing, it was very
intermitant, as tapping on the case would fix it for a few hours/days...

Well what I am after is a list of the better PD games, colour/mono
that will run from a HD on a ST/STE etc...

One that I did not loose was Starball, this would be one of the best around..

Thanks.....

2038. Re: IMPORTANT NOTICE ABOUT HENSA ACCESS

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 11:48:56 UTC
From: sbrown@cee.hw.ac.uk
Message-ID: <D3qE5L.3H8@cee.hw.ac.uk>
Source record: 171781

What people don't seem to realise is that World Wide Web services put strain on the server machine on which the HTTP daemon is running. So computer managers restrict access (through stopping non ac.uk access for example, as in this case) so a machine they (or rather their employers) own is not weighed down by processes initialiased by users all over the world. The machine was likely as not bought for the purpose of providing WWW services, but for some function within the organisation - it's not fair for them to loose vital work time just because people all over the world happen to want to download some software.

WWW does not have any user number restrictions - that seems why HENSA are wanting users from outwith the UK academic community to use FTP instead - so the use of *their* machines is controlled. (The control is on two fronts, restricting WWW access to ac.uk and restricting FTP access to a certain number of people).

To understand their reasoning, imagine how you would feel if your machine slowed down during a busy work schedule just because somebody a couple of thousand miles away is wanting a piece of software. And does it really matter if you have a WWW interface to download? I wouldn't have thought so.

Tangerine Dream also used Atari systems on their _Optical Race_ CD (which I like a whole lot!). They used to tour with Six ST systems, running Steinberg-Jones software that became Cubase.

I also remember seeing an ST running in a Paula Abdul video a few years back.

2041. Help - MS-DOS formatting on ST/e

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 14:45:57 UTC
From: ontarget@admiral.uucp
Message-ID: <a8F0Zc1w164w@admiral.uucp>
Source record: 171788

Requesting help with regard to MS-DOS/Windows/ST/STe formatting problem. For
the past few years I have made considerable use of my public library's
wonderful CD-ROM resources, gathering hundreds of text passages and
source listings for future research forays. My initial move is to
download the file from the library's CD-ROM to my own 3.5" floppy disk.

In the past I've had no problem using my Atari 520STfm
(upgraded to 2.5MB of RAM, TOS 1.0) or Mega STe (4MB,TOS 2.05) to
format a floppy that could be read on an IBM or clone. I've used a
(fairly old) PD utility called IBMFMT.TOS that has always done well
to format a double-sided disk with 80 tracks, I think. I've always
understood that Atari STs were designed to be able to read MS-DOS
formatted disks with no problem whatsoever. This is important since
the library operates on a system of IBM clones.

Unfortunately, the last few times I tried to save library files to
my disks I encountered disk error problems. When the chief of the
library's computer system examined my disk in one of the (MS-DOS)
computers, it did not recognize the ST-formatted disks as MS-DOS
compatible. The chief reformatted one for me, but when I got home
with the disk, I couldn't read the disk on either Atari.

For those of you who operate IBMs or clones and Ataris, should I be
looking for help from newer formatting software? The library's units
are 486-based and operate under DOS 5 or 6 as well as Windows. Is
there anything about these units that would render my old IBMFMT.TOS
ineffective? If I format using a new program (please identify) will
my Ataris be able to read from AND write to disks formated for MS-DOS
after I've downloaded from a clone? I've not encountered this problem
before, and would appreciate any advice. Thanks. DF

2042. DMJ software's address?

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 15:12:08 UTC
From: ied2@aber.ac.uk
Message-ID: <3hdbc8$pj2@osfa.aber.ac.uk>
Source record: 171789

About a fortnight ago I tried to register a shareware product called DMJGIF3
for the Atari ST. I sent the international money order etc to the address
which appears onscreen in the actual program. Today the letter was returned
to me marked "return to sender - A.P.O. no longer exists".

Does anyone out there know DMJ software's new address?
Or, failing that, does anyone know the email address of DMJ himself?
Damien M. Jones used to be a regular contributor to Atari Explorer Online
magazine but I've checked a few old copies and can't find any mention of his
email address.

Can anyone help me?

Thanks in advance.

2044. Re: ST Games decline... Producer's Fault?"

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 15:40:35 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HMUBTEWTC2AAU402@SNYONEVA.CC.ONEONTA.EDU>
Source record: 171792

When I was strictly an end-user, I used to have the naive belief that
the game development community was strictly biased against the ST community.

This changed when I eventually got involved with Shareware and commercial
ST game products. Its simply a matter of economics. There isn't a
huge market for ST specific products anymore - hasn't been for several years.
When you have an audience of 50 million potential customers such as the
MS-DOS market does you can afford to invest the time and financial resources
on a project and come out ahead even with rampant piracy.

However, with the decline in Atari oriented dealerships, magazines, and
mail-order outfits world-wide, it makes it very hard for a game publisher
to continue to support the platform. Simply put, people just don't know
your products are available, where to get them, etc.

On the PC market - you can create a shit game and still sell 10,000 of them.
On the Atari market you virtually have to invent the wheel and hope you can
sell 500 copies. On top of that, you still have to spend on advertising,
development, and production. It just isn't worth it anymore for many
individuals including myself.

I also agree that the basic ST series is really showing its age. 16 colors
, 720kb disks, and an 8mhz system no longer cuts it. Sure, due to the ST's
video architecture, a well-written arcade game w/lots of sprites can still
give many PC's a run for their money but the ST can't do much else.

The Falcon has amazing potential for games because of its superior speed,
RAM, processor, and sound & gfx capabilites. Unfortunately, its too little
too late (and priced way too much). Virtually all of the main developers
have left and the Falcon's potential will remain unused.

The ST has had an incredible influence on the gaming industry and many
classic titles first appeared on it. But now its dead and you can blaim
blame market forces for its death.

Just my opinion on this issue - flame me if you will but most of you will
see that I'm not that far off from the truth or reality.

Ari

From: starkrl@aston.ac.uk
Message-ID: <D3qpsn.65r@aston.ac.uk>
Source record: 171793

Hi there,

Is anybody out there selling a SCSI controller of any kind?

From what I've seen, the Top Link controller is pretty good, as it consists of simply a cable to go between the atari and hard drive with a bit of circuitry in one end of the lead, and it apparently works well.
The only thing is, I can't believe how expensive they are! (I haven't found one for cheaper than 55 quid so far, although I'm yet to phone The Upgrade Shop which may be cheaper)

So, if anyone can enlighten me on this subject, or even better, if anyone is selling a controller, then please reply (either to comp.sys.atari.st or to me at starkrl@aston.ac.uk).

Thanks!

ROB.

P.S. I've got a 1MB STFM and will soon have a 260MB SCSI drive!
I hope it all works OK....

Tramiel said not long ago Atari is still manufacturing
Falcon 030 (not very important quantities) and that he never planned
to stop the prodution. Some rumors say that Atari will show a new
computer in the near future. It seems like they were waiting for money
from the Jaguar to release their new bomb (?).

<stuff deleted>

Well, I was pissed off that the software companies insisted on producing for the
STFM and
fobbing us off with screenshots from other machines, making things that were
clearly too
ambitious for it (stating revolutionary claims of new standards in technical
achievement and
so forth) then saying that they're stopping because we weren't buying them. Why
? Because
we caught on and didn't take their shit. It's their own fault that they've lost
a market.
Although I doubt it will really affect them.

So many times I've been outraged at crap scrolling and shitty sound. Sure, the
STFM can't
mess with samples like the STE or Amiga, but programmed carefully, that old

Yamaha can
produce some *beautiful* noises.

It's not really fair to say that everyone knows the ST is much better. Both machines have
merits and weaknesses. However I do agree that whilst a game should be first and foremost
PLAYABLE, it has annoyed the hell out of me too that we were fed this constant rubbish by
the big companies. I'm sure that Sensible games are playable, but they really needed to
use STE or more powerful hardware (TT030, Falcon ?). Sensisoccer was a pretty good laugh
but could have been executed better. I was insulted by Cannon Fodder. ST Format's demo
version didn't even work on the MegaSTE, so I had to get the old STFM out - and it was
terribly jerky, with sound that made me want to cry.

I recently got Obsession for my STE, and I'm pretty sure that if even just half the ST
games of three years ago were always being produced to this standard, things would be
different now. Amiga games weren't any more playable, just executed better.

Just my opinion.

S.Lai

>Somebody mentioned that the power supply might be faulty. If so, what can I
>do about it? Also, a couple people mentioned the MMU, but I think those who
>did were unsure if the ST has one. Anyone know if it does?
>Me far. You near.

I am not sure if the Mega had MMU or not (pretty sure NOT) I know the ST's
didn't have MemoryManagementUnits. I am pretty sure they could only be used
starting with 68030(or maybe 68020-but as this concerns Atari - that doesn't
matter) so that means the TT and Falcon.[and now Medusa, Eagle?]
have fun with your mac
have more fun with your atari :^)

Source record: 171704

>Okay, so I now have my pretty smart Falcon sitting in my bedroom, connected
>to my USRobotics 14,400baud modem. Question is can I get more than 19200 bps
>out of my serial port? Apparently, speeds of up to 115000bps are possible
>with a little hardware upgrade. *A software patch would be ideal*
>I'm looking for 38400, or 57000bps......

Yes, install hsmodem (PD) which allows for higher speeds. Also, Connect
(shareware) is the best program to use on the Falcon. It has a very fast
built-in zmodem and works with and without hsmodem.

Hello:
I've been looking around (casually) for TT's and other assorted hardware to
but while I save up some cash. I am a graphic artist, and while I own other
machines(MAC< IBM) I would like to make full use of CalamusSL and other
software which I can't really do on an STe. One of the video cards I was
looking at seriously was the Cyrel Sunrise video card, but I keep hearing
about ET4000. Would someone tell me about this card, and some specs would be
nice also.
Thanks.merci

>Atari Jaguar Homepage (Buy one! They are good!)
>http://www.bucknell.edu:80/~svensson/

The reason that I am just fed up with this Hensa thing is because we only have Gopher and Lynx Web access here...

Their are only 3 sites that have some sort of Gopher support for Atari file extention formats, A..A. (but not .tos) Hensa and tu-Berlin..

All other sites have very poor or no support for Atari file extentions..

I can use a FTP Gopher server to access Hensa, but that does not give me access to the Atari files with Atari extentions, due to these Problems with Gopher, their are similar problems with using Lynx.....

The other problem with Hensa is only restricting Atari users and the limit of 6 users, why are Amiga users not restricted..??

Noteting the other sites listed here, cnam.fr is not up to date and the A.A. mirror is just that, Hensa has stuff that is not on most sites and has English versions of German software, plus its the home for the Atari Web...

Heavyweight or not, it's all we've got! STF is now the ONLY mass circulation ST magazine left, in the UK at least. If you are so dissatisfied with the content, do something about it. When was the last time you had anything published in it - or anywhere else?

You know what they say - those who can, do; those who don't, criticise.

2062. ACE95 exhibitor question

Newsgroup: comp.sys.atari.st
Date: 1995-02-09 22:25:56 UTC
From: ac382@freenet3.carleton.ca
Message-ID: <D3r7n8.5pJ@freenet.carleton.ca>
Source record: 171712

I noticed that the ACE 95 update has Oracle BBS listed as the first GUI Atari BBS. Can anyone give me any information about contacting the authors or disctributors of this software. Is there anyone that has actually seen or used it? I sent off a letter to 'somewhere' but I guess it never got to the right place :(. Anyone?

I posted a similar querry a few months ago but did not recieve any replies so if you know anything about it please let me know.

thanks

You could also try the Translator from System Solutions in Windsor. I can't
promise it'll be cheaper, but it works. I've had one on my 170Mb Minis drive
for nearly two years without problems.
I've not found The Upgrade Shop to be particularly cheap, but he's pretty
good on the service side

best of luck

I have the following ST related hardware and software for sale. Please
send me e-mail with your offers:

HARD WARE

Atari Mega ST2 upgraded to 4 megs with Z-Ram upgrade
TOS 1.04
Hard drive in monitor type case with Seagate 85 meg drive and
Syquest 44 removable drive with 4 carts!
SC1224 color monitor
SM124 mono monitor
Original boxes for computer and monitors
Monitor Master
PC Ditto II installed internally
Spectre GCR with roms
VideoKey
Discovery Cartridge
IB 5 1/4 inch drive
MFD 1080 drive [3 1/2 drive works, the 5 1/4 drive non-functional
and has been removed]

APPLICATIONS SOFTWARE

Speedo GDOS
Multi-TOS
Atari Works
DC Desktop
DC Utilities
Hypercard Developers Kit
WordPerfect ST
Wordflair II
Regent Word II
Warp 9
TV Title 2.0
Multidesk Deluxe
Degas Elite
PC-Ditto [PC software emulator]

GAME SOFTWARE

Purple Saturn Day
Impossible Mission 2
Championship Wrestling
Knight Orc
World Games
The Pawn

Guild of Thieves
Sinbad and the Throne of the Falcon
Rocket Ranger
The King of Chicago
Battle Chess
Midi Maze
Shufflepuck Cafe
Xenon 2 -- Megablast
Final Assault
Mean 18
Blackjack 3
Road Blasters
Jinxter
Pac-Land
The Crimson Crown
Transylvania
Questprobe -- Spiderman
Superbike Challenge
Super Kidgrid
Thundercats

Plus the following compilation packages:

Precious Metal includes:
Arkanoid Revenge Of Doh, Captain Blood, Xenon, Super Hang-On

Triad includes:
Starglider, Defender of the Crown, Barbarian
Magnum 4 includes:
Batman, After Burner, Operation Wolf, Double Dragon

Microdeal Hot Disks Volume 1 includes:
Goldrunner, Jupiter Probe, Karate Kid II, Slaygon

The Story So Far Volume 1 includes:
Beyond The Ice Palace, Buggy Boy, Ikari Warriors, and
Battleships

Mega Pack includes:
Winter Olympiad 88, Mouse Trap, Plutos, Blood Fever, Seconds
Out, Frost Byte

5 Star includes:
Barbarian, Crazy Cars, Enduro Racer, Wizball, Rampage

Action ST includes:
Deflektor, Northstar, Trailblazer, 3D Galax, Masters of the
Universe

Giants Collection includes:
Out Run, Gauntlet II, 1943, Street Fighter

Premier Collection includes:
Exolon, Nebulus, Netherworld, Zynaps

ALL ORIGINALS!!! I am also the original owner and have taken good care of my equipment. Most with original boxes and documentation. You pay shipping if you cannot pick up.

It's actually a localtalk port, which is really just a fairly standard serial port. I don't know if you've ever networked a Mac, but to do AppleTalk you need a small box you run a lead to. You can then link this box into a chain.

: anybody successfully networked a TT with a Mac? I assume that additional
: Atari software would be nessecary, does anyone know where it may be had?
: Commercial or PD or shareware? What sort of problems or hurdles have you
: encountered? Is there an additional hardware interface required?

I know of no current PD or shareware software. However - a couple of interesting snippets. There are at least two 'cookies' reserved for commercial networking systems. As to whether these support appletalk, who knows?

Secondly, MiNTnet is described in the doc as being ready for extra protocols such as Appletalk. Maybe someone with technical knowledge could help.

ATB,

Martin

THere are two packages I know of that network TT"s and Falcon's via the
Lan port, but not on a Mac..

Powernet and AD net I think...however both don't like multitasking networks
so only in singletasking mode...powernet requiers the use of powerdos.

Message-ID: <792389950snz@bassland.demon.co.uk>
Source record: 171721

This message it deviating from the subject a bit....but,

Okay, so I have a mac connected to my ST via its Appletalk port (The minature DIN socket). This is connected into my STs serial port. I do file transfers mainly, so I can use my HP Deskjet to print Mac docs. The LAN port on the Falcon has an identical pin-out.....But when I connect the wire from my ST into the Falcon, I cannot transfer any data. Because I don't have any programs that even read the LAN port, even though it is (really) a second serial port. I do have the X-contol accessory, but I cannot select the LAN port (or COM2). Only COM1 is there, but it is greyed-out so it's unselectable. [GFADRAFT however, did give me the option to output to printer, RS232, or COM2! when I selected the 'print' option.] Whats going on?..?...?

Can I get an extension to Xcontrol or even a program that reads the LAN port on my Falcon? BTW - writing a program to actually 'network' a TT or Falcon to a mac, shouldn't be that difficult, after getting a book or two on how the mac OS treats treats the data. Trouble is, I have no programming languages on my week-old Falcon, yet. Only on the ST. (But none of them are compatible) [What does AFAIK, stand for, I want to know as well. Hmm?]

> Does anyone know where I can get a FPU for the Mega STe or Falcon?

Just visit your local computer-store and ask for a 16 or 20MHz 68882
in PLCC-format. If you`ve got a Falcon then it`s just to plug it in,
but on the MSTE you will also need a GAL in order to make it work.
To get your hands on such a GAL you will probably need to turn to an
Atari-dealer, which are hard to find these days. :-(

> BTW, does Atari still exist?

Yes, byt they are concentrating on the video-games market.

^^^^^^^^^^^^^^^^^^^^
IT DOES HAVE A MMU

it is one of the Atari ST's custom chips.
Haven't got my docs here, so I can not give you more info right now.
Maybe later.

What version of NVDI do you have? 2.5 worked fine on my Falcon. 3.0 had a bug which made it bomb when changing to Truecolour. This has now been fixed, and if you have the bugged version you can upgrade free.

No, no Amiga users can get on either. It is not just the Atari section.
Do you think i would want just the Atari section to hav this
restriction? You should know me better by now.

> Report." ^^

S > Please note the word "is" I stated that I had put 2 and 2
S > together from the article in STR that I had read..

That's the problem, Roger - you read the article in ST Report,
put 2&2 together, and got 22.

Also remember too, though, that even if Ralph Mariano WAS
intimating that it's GEnie that's going into Chapter 11, that he has
an ulterior motive for doing so (i.e. getting himself and ST Report
kicked off GEnie for numerous improprieties about two years ago).
Ralph's little actions and reporting of "fact" when he's got a
vendetta against somebody is well-known. Just ask Darlah Potechin
(GEnie's ST sysop) about the things he's done to her in the last two
years if you don't believe me - his tactics are just like yours,
screaming, name-calling, abusive language, dropping of innuendo and
rumours that can't be substantiated, twisting the facts to make
damage points against his "enemies". The only difference is, he
often utilizes the "Jerky Boys" method of hurling abuse (ie over the
phone).

Note - Dana (ST Report's Atari writer) is okay, you can believe
his articles. But anything written by Mr. Mariano should be taken
with a LARGE box of salt. As should most of YOUR postings here.

S > My facts are ok, but the problem is you can't read...!!! May
S > be you should not add your thoughts to my posts... My
S > thoughts that you need a Brain, or get a far better
S > computer......

My thoughts are you don't like being exposed for what YOU are -
a pathetic little man who can't or won't admit that he's WRONG and
says so - and who, when backed into a corner, spouts off tons of
abuse and vitriol at all those he perceives to be his enemies.

I'll keep adding my thoughts to whatever you spout off, Roger,
whether you like it or not. I may not always be right - but I CAN
express what I perceive and know about what the real facts are. And
I stand behind everything I've said

And, by the way, Roger - I CAN read. Not only that, I can WRITE,
too. AND I can spell.

My computer's okay. It's your attitude towards me and my
computer (or for that matter, ANYONE who owns an Atari computer)

that stinks.

And Roger - from now on, I request that if you reply to me, kindly cut out the swearing and the abusive language and try to reply to me in a civilized manner. If not, kindly SHUT UP and go to the next post!

As for your constant accusations that I'm a liar - well, a large number of people here have seen enough of our posts to determine who the liar really is. A few have even congragulated me for standing up to you and your bullying, ham-headed ways.

There are also quite a few who are fed up with all this. And I don't blame them. To you, I apologize for having to be put through another one of Roger's fits of abusiveness when he's been once again proven WRONG.

... Oh, YEAH? Well beam THIS up, pal!

V > So what I have been doing has been worthless? [FX...Danny
V > walks off, sulking, and thinking where he went wrong, and
V > totally hurt by Roger's comments]

Don't worry Danny - even though I don't have Internet access, I certainly appreciate what you've done to help out other Atari users on the nets, and your efforts here to show other people just what is available on Atari HENSA. Don't let the wibblings of a known cheesehead get you down.

Although it must hurt - you were the only person who actually defended Roger after I read him the riot act the first time, and explained that he actually has done some good. And now he does THIS to you.

I've done some stupid things in my time - maybe standing up to Mr. Sheppard is one of them. But I certainly remember those who have done me a kindness. I certainly wouldn't want to hurt any friends I have here - and I (and a lot of people here) consider you a friend.

I hope Roger does go for that PC soon - so he can leave us all in peace.

Keep up the good work - and may the Roger Sheppards of this world never get you too down :)

... Without my ignorance, your knowledge would be meaningless.

>HOW?

I have not done it myself, so I cannot comment on the actual process. Some folks over here in the MausNet have talked about it and described the necessary steps.

I would guess you have to remove the internal screamer (pun intended) and perhaps fiddle with the mounting.

To use SCSI internally, you have to make your own cable.

2088. Falcon Update Digital 8

Newsgroup: comp.sys.atari.st
Date: 1995-02-10 12:23:12 UTC
From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3hflrh$33h@bs33n.staffs.ac.uk>
Source record: 171733

FALCON UPDATE DIGITAL Issue 8 is now uploaded to:

ftp.cnam.fr &
ftp.uni-kl.de

at present it resides in the incoming directories but no doubt it will be moved to Atari/Falcon/Magazines and atari/falcon/magazines accordingly (and other sites).

The filename is update_8.zip and will fit nicely onto a high density disk, obviously its Falcon030 only but it should work with 1meg of memory (untested so no guarantees) and is 100% RGB or VGA compatible now (and there is a new shell which is a little fast and nicer). So give it a go, there is plenty of text files to read about all things Falcon, Jaguar, Atari and other and even some free bits of obscure software you might not have thrown in for free. Unpacks to about 1.8 megs on your hard drive.

Issue 9 contributions welcome (hint hint)

RiCH

2089. sound converting program for the ATARI ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-02-10 12:43:28 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <3hfn1gEmb9@uni-erlangen.de>
Source record: 171734
Cross-posted to: alt.binaries.sounds.d,comp.sys.atari.st,maus.sys.atari.software

Five to Five V2.01 for the ATARI ST/TT/Falcon

525 is a GEM based sound converter for all ATARI computers, running under TOS and MultiTOS. The program is now available in a new version in german and english.

525 can convert any of the following formats into any of them:

- DVSM (used by WinRec/WinCut for the ATARI Falcon)
- AVR (used by many ST/TT/Falcon programs)
- AU,SND (used on SUN, NeXT)
- WAV (used on PC's)
- HSN (used by CrazySounds for ATARI)
- CIT (used by Fortune for ATARI Falcon)
- AIFF (used on Mac, ATARI)
- AIFF (as used by Cubase)
- Raw (for many other cases)

You can also convert from 8 bit to 16 bit (and vice versa) and from Mono to Stereo. Also different packing algorithms are implemented.

525 will be available at ftp.uni-stuttgart.de, ftp.uni-muenster.de and hopefully atari.archive.umich.edu (and other ftp sites).

A version for OS/2 will be available in a few days, too.

Ok after reading much about Atari's efforts to drop computers and play all their cards on a gaming system I decided to try to find one.

With their rap as a gaoming company I thought the most likely place to look would be TOYS are US. The cleark told me all this store sold was Sega and Nitendo systems. (As this is a chain I would assume this applies to all).

The adds in Next Genetation and the data in the Jan CAIN newsletter imply that these systems will be offered in some 8,000 outlest.

(However, reading real close this was some witch reading here cyrstal ball for the years 95 and 96).

So if I wished to try a system hands on and see it in action where might I go about finding an outlet (this is from the sticks of Mississippi--when I wanted to buy my first PET computer in 1978 I had to go to New Orleans to get one and the whole incident was my first published article in Dr. Dobbs).

The SCSI type is the better solution, and it DOES work on TTs and Falcons (if
the SCSI bus is set up correctly...).

One might consider buying the GT 9000, it's a brandnew 600 dpi engine and works
with the GT-Look II software.

2099. Keyboard Maps

Newsgroup: comp.sys.atari.st
Date: 1995-02-10 17:37:22 UTC
From: bericd@bri.hp.com
Message-ID: <D3soyA.6Fo@bri.hp.com>
Source record: 171744

Hi All,

I have recently fitted the PAK board into my Atari, along with TOS3.06 in German.... The language I can cope with by using Teradesk - but the problem is that German TOS = German Keyboard. (You try finding the "\" key!!!!)

So what I want to know is what SIMPLE and SMALL utility is there to edit the standard keyboard assignments? I know we have Harlekin and the like that can use a different keyboard map - but I don't want to use a 1/2 Meg program just to do this small task.

If it comes to it I will write my own prog to do it, but is there anything I can ftp that will do the job?

Beric..

2100. Calamus Printer Driver for Epson Stylus 300 Needed

Newsgroup: comp.sys.atari.st

Feb. 10, 1995

Please excuse the cross post. If there is a more appropriate location,
please let me know.

I need a Calamus SL printer driver for the Epson Stylus 300 ink jet printer.
I have Epson LQ and others, but they simply don't work properly.
Any information or assistance would be greatly appreciated.

I may be reached as follows:

E-mail: sar@cts.com
FTP dropbox: ftp.cts.com /usr/spool/ftp/pub/sar/incoming

Thank you very much,

-Scott-

You must have had different STs to me. I've had both STFM and STe and both
have MMU chips - how on earth do you think they manage their memory?

Quote from "The Complete Atari ST" from Atari ST User mag:
"(the) MMU - Memory Mangement Unit: Another Atari custom chip with two main
functions. It is used to keep track of up to 4Mb of memory. Whenever
another chip - such as the processor, DMA or shifter - wants to read or
write to a location in memory, the MMU makes sure that the correct address
in RAM is available to it

try again, ken, et prends plus soin prochain fois

Okay Hendrik. Here is a bit of a message a friend wrote sometime ago.
And before you say anything, this guy knows what he is talking about, so
you better be prepared for a little supprise.
And btw. i'm not giving you this guy's name, yet!

Greets
Kim

There now follows a complete rundown on EXACTLY WHY the 68040 is something
we should all encourage. :)

What your friend says is basically correct as far as compatibility is
concerned (030 is an 040 without an FPU) but in the real world of speed and
efficiency this statement does not do the 68040 the justice it deserves -
assuming he did actually get the 030 & 040 back 2 front! 8O)

The 040 has a number of additional enhancements which make it a more
efficient chip than it's predecessor, and basically every other processor in
it's class. I will explain why.

>>>>>>>

The 68030 carries around 300,000 transistor gates on it's footprint. The
68040 has approximately 1,200,000. Admittedly much of this goes on the new
cache and the FP math unit, but this still leaves a load for use by the
processor itself.

The 68030 relies on a small (but significant) amount of MICROCODE or 'gunk'
as it's referred to in the chip world. This means intstructions are not
streamlined and are not as fast as they could be. The 68040 contains no
microcode - all of the instructions have been rebuilt and hard-wired for

speed. Few CPU processors can boast of this!

The execution unit is now fully parallel with a multi-stage pipeline eliminating most of the hold-ups inside the 68030. This means that different instructions are being fetched, decoded & executed simultaneously in up to 5 stages inside the pipeline (it could be 7, I forget). This is what gives the DSP56001 such a high instruction throughput - but unlike the DSP, the 040 pipeline is dynamic. There are no ILLEGAL instruction combinations that will clog the pipe!

The floating point unit is NOT to be compared with the 68881/2 as it is WAY ahead of either of these chips. The 040 FPU is MUUUUUUCH faster.

A typical example is that a 68882 floating-point multiply can take between 50 and 100 clock-cycles to graduate (I have the exact number in a book somewhere). The 68040 can manage it in just 4 cycles. The 68882 takes well over a hundred cycles to perform a divide - the 68040 takes about 9. This kills chips such as the 486 which can't even come close to this sort of efficiency, and is the main contribution to the fact that the 68040 outperforms the Pentium at the same clock rate. In actual usage the 68040 leaves the Pentium standing as it is so far still running old 486 code.

The cache consists of 2 x 4k blocks instead of the 2 x 256byte blocks present on the 68030. This makes a HELL of a difference. The chip has a write-cache with delayed-write/snooping ability which means that data written to RAM can hang around inside the cache until a device (screen, blitter, DMA sound etc.) looks for it. Only then will it be written across the bus and suffer a bottleneck. This means that bus-referencing is drastically reduced to the point where it only interferes with large block-transfers, leaving almost everything else significant completely inside the processor. Also, the chip snoops ALL busmasters, not just the caches (although the I/O ports are ommited from snooping, but that's a computer engineering problem...). Motorola claim a 97% hit rate on the cache on the 68040 - it's a bit of a 'seasonally adjusted' figure but it is very high.

This would suit the Falcon fantastically as you could have a crippled 16-bit bus and still get the rediculous MIPS throughput to be expected of the 68040. In addition to this, the write-cache & bus-snooping system means that self-modifying code is no longer a problem - compatibility with the 68000 is actually HIGHER on this front which can't be bad news.

You might wonder what happens when a large block transfer occurs - as it inevitably will. Well, Motorola has covered this also with a complete read/write burst access to & from the cache.

When the cache is enabled, any data required by the processor can be accessed quickly if it's in the cache already - at the cost of a tiny overhead. This is a cache 'hit' and is usually good news. If the data is not present however, the small overhead in addition to the time taken to finally get the data from the bus is higher than a straight memory-reference. This is a cache 'miss' and is bad news. What the 040 does (and what the 030

should do but doesn't) is grab a chunk of 16 bytes in one go and then cache-check the whole lot. This is more efficient than checking each of the smaller 4byte chunks one at a time. This is known as 'burst access' and the 040 is fantastic at it.

As an added note, the 486 has no write-cache and no bus-snooping and cannot perform burst-writes to memory. Just for information's sake!

One of the most significant improvements on the 030 is the arithmetic unit. The 030 takes about 18 cycles to perform a multiply instruction (on a good day), whereas the 68040 takes just 1. This is MUCH faster than the 486, and is similar to the Falcon DSP. This is known as a single-cycle multiply, or a 'parallel multiplier-array'.

There are new instructions including 'move16' which is complete overkill as it allows you to move chunks of 16 bytes around in one go. This is a rare and amusing addition.

Now the juicy bits...

When compared to the 68030 (yes, I will offer figures), the 040 performs around 15 times faster AT THE SAME CLOCK RATE. That is 16Mhz.

The optimisations made to the instruction units were based on statistics involving hundreds of millions of lines of code from real-world programs. Few processors can claim this...

The 68040 offers a MIPS rating almost as high as it's clock rate, about 26MIPS at 32Mhz - that's basically RISC throughput on a CISC architecture. And Motorola are VERY proud of this as they well should be.

A 68040 is capable of this sort of insanity:

```
move.l ([label.w,pc,d0.l*8]),([a4,d4.l*2],offset.w)
```

A bog standard RISC chip (i.e. Console or otherwise) would need to do something like this to achieve the same effect:

```
move #label,a2
move pc,d1
add d1,a2
move #8,d2
mult d2,d0
add d1,d0
move d0,a0
add d4,d4
add d4,a4
move (a4),a4
move #offset,d5
add d5,a4
move (a0),(a4)
```

Good RISC chips could probably get away with half this many instructions, but you get the idea. If the 68040 and a RISC variant both have roughly

equivalent MIPS ratings at the same clock rate, the 68040 only needs one instruction where the RISC chip could need 10 to do the same job. That makes the 68040 at least 5 times faster than the RISC at the same clock rate - with room to breathe. Not bad for a CISC design!

In fact, these statistics make the 68040 the most streamlined, efficient, powerful and advanced processor in it's class. Motorola claimed that it struck at the heart of RISC with a single blow...

The 68040 boasts one of the most extensive sets of addressing modes (as shown above) available to any chip. The sick thing is that it doesn't actually inhibit speed. This makes the chip more efficient even than the Pentium which has a much weaker set of instructions.

The actual throughput of the 68040 is an astounding 1.25 cycles per instruction which compares favourably with 1.7 on the 486. This is also faster than the ARM (1.3) or SPARC (about 1.3). RISC-users might think 'hey - that's tame by our standards' but then it's not a (R)educed (I)nstruction (S)et (C)omputer chip. It can easily manage 8 times as much in one instruction as RISC as it has a 'Complete' unrestrained and even over-the-top instruction set.

And anyway, it's internally double-clocked - A 32Mhz 68040 is actually ticking away at 64Mhz.

I realise that the message quoted above was meant to keep things short and sweet, but I'm sure people might balk at the thought of getting an 040 on that information. I hope by now that people will not look at the 68040 as a '68030 with a FPU built in' and will see it as it actually is - it could be the future of our machines!

Anyway, If you want any more statistics or other technical junk on the Motorola chips / instruction sets then drop us a message!

From: vsnyder@math.jpl.nasa.gov
Message-ID: <3hgljs$63c@netline-fddi.jpl.nasa.gov>
Source record: 171660

I have a Teac FD-235-JS, which is a 2.88/1.44/720 floppy, with a SCSI interface. I assume I can connect it to my ST through my ACSI->SCSI adapter. Is there any software to drive it after I connect it?

My brother still has TOS 1.02. What's the latest TOS that will work with his 1040 ST? Where can one buy it? What's the cost? If it's a 2-chip TOS, where does one get instructions on modifying a 6-chip-TOS motherboard to use a 2-chip TOS?

Until he gets a later TOS, my brother needs some stuff to fix up TOS 1.02. I remember something to repair the slow FAT scan problem (turbotos, or turboST?), and a new file selector somewhat like the 1.04 file selector (little green file selector?). I forgot the file names. Can you give me a clue? Of course, ftp://host/path/file would be even more helpful!

My brother has a Star SB-10 printer. It _doesn't_ have any Epson emulation modes. It's a 24 pin printer. It does a nice job printing from 1st word (after we wrote our own printer description file). He's _never_ been able to get a coherent screen dump -- just junk. Several folks recommended the Degas prt_inst.acc, but there don't seem to be any drivers for it to use the Star SB-10. Do you have any, or know where to get them, or how to make them?

Furthermore, he's just bought STraight FAX!. Upon opening the box, it says he needs to buy a GDOS, which he doesn't have yet. If there are no GDOS drivers for the SB-10, it seems he ought to send STraight FAX! back, and get STar FAX from Ingo Linkweiler. Do you know of a GDOS printer driver for Star SB-10, or, is it simple to make one (like the textual descriptions 1st Word and WordPerfect use)?

I know it's possible to attach SCSI tape drives to the ST, and get software to drive them. I have a Summit SE-120, which attaches to the floppy cable in a PC. It's probably possible to attach it to the floppy cable on the ST, but, having done so, is there any software for it?

I have a ESDI disk (CDC 94161-101) attached by way of an Emulex MD21 SCSI <-> ESDI bridge. When I had an MFM disk (Seagate ST-4038) attached by way of Adaptec 4000, it would autoboot. Now the ESDI won't. (Yes, I've installed the boot sector - Supra tools. Yes, the Supra tools insist it's ready for auto-boot). I also have an antique Magic Sac with burned out Mac ROMs. I have access to a PROM programmer. I have the Hitchhikers guide to the BIOS, wherein some stuff about the cartridge is explained. But I don't know how to transform SUPBOOT.SYS or SUPBOOT.PRG into a form suitable for the cartridge. Can you tell me how? Or maybe you have other disk software you'd like to recommend (but I'd still want to put it in the cartridge if it won't autoboot either).

Thanks in advance.

Send e-mail please. I don't read this column very often; I don't think
many folks are interested in Star SB-10 printer stuff anyway.

Hello,

Does anyone know if there are any special posting guidelines applicable to c.s.a.st and c.s.a.st.tech, or do the normal Usenet ones apply ?

There seems to be a lot of arguments going on regularly about whether subject X should be discussed here or there etc etc. IMHO I feel it would be easier to reduce these flames if there were a definitive set of rules, you either abide by them or break them, no arguing about it.

Just an idea.

In a during a conversation with someone I trust as a "reliable source", Sam Tramiel, president of Atari Corp., said (and this is necessarially a paraphrase), "IF Atari decides to go back into the computer business, it will not be with a 68x00 based machine"

To me, "IF Atari decides go go back into the computer business..." means that as far as the president of Atari Corp. is concerned, they are NOT today in the computer business.

Atari has said that if anyone wants to order a quantity of any of their products, they'll manufacture the product for them. They didn't say how many units would be required as a minimum order, and I've never heard of anyone actually doing this.

Atari ran a small manufacturing run of TT030 computers during 1994 as Jaguar game system development platforms, but I've heard of no other computer manufacturing.

As for rumors of "new" Atari computers, anyone you talk with at Atari will tell you they are fully committed to the Jaguar video game system at the moment.

Of course, no one can say what the future may hold.. but I wouldn't hold my breath waiting for a "new bomb" from Atari.

Not heard of this serial line 'hack', but control lines are often used for carrying data on parallel ports - especially if the data lines are unidirectional only.

> Is this a dumb idea? Too hard? At least with serial you are very
> unlikely to blow anything up if you wire it wrong - provided you plug
> it into the right socket :-)

Its not a dumb idea - but OTOH you'd get more throughput via the parallel port. MiNT-Net has drivers for running SLIP through this port (PLIP). Unfortunately this doesn't look to be compatible with non Atari PLIP due to the same deficiencies in control lines that stop pocket lan adaptors working.

:-)

Roland.

```
FOR SALE: Atari 520STfm (stock: 512Kb RAM, SS internal floppy)
Atari SC1224 color monitor
Assorted software

Software includes Word Writer ST, Word Up!, Fontz, Disc Doctor,
GFA-BASIC 3.03, Dungeon Master, and much more -- plus five disks worth of
archived public domain and shareware files.
The system is currently boxed up, but could be set up for a demo
if needed. Everything worked the last time I checked, though that was
quite a while ago at this point.
Delivery is avaliable in Montgomery County, but could probably be
arranged for any other place nearby (depending, of course, on whether the
sale price is more than what it'll cost in gas. *grin*)
Best offer will be accepted.
Questions? Comments? Feel free to EMail me.

2121. HELP! Hard Drive Fuck-up

Newsgroup: comp.sys.atari.st
Date: 1995-02-11 02:53:08 UTC
From: dogmeat@netcom.com
Message-ID: <dogmeatD3tEoL.3Gu@netcom.com>
Source record: 171669

All:

HELP! I am experiencing a near-fatal problems with my Atari SH204
20meg hardrive.

Symptoms: Shortly after booting up, the computer fails to find
any files with the dialogue box. Sometimes the screen is blank, sometimes
the files are garbage and unselectable, sometimes only the current PATH
is usable.

I have noticed that the symptoms begin when the hardrive unit
makes an audible 'sigh' that sounds very much like a power surge or a
refrigerator switching modes. Until that time it functions normally.

After the error occurs, the hardrive is unbootable.

Thanx for your help!

I did see that post. Could you provide a little more detail on the
subject, like a source maybe? And please don't quote any Intel employees.

>IMHO, APEX is not for proffessional use, as it does not provide Anit-Aliasing.

Check again. It does anti-alias, and very quickly too.

>and so on.

So what? You can't record/playback 16 tracks D2D with a Soundblaster 32s
either. Furthermore, what does that have to do with processing power?
Databases are software!
You didn't address my point at all. What operating system do you
think you can run on an Intel chip that even comes close to MagiC for speed on
a similarly powered Motorola chip? Even given another 4 megabytes of memory,
OS/2 (which is probably the best competitor short of the 32 megabyte gulping
NeXT Step) still can't touch MagiC for speed. Nor can Windows, Windows NT,
MS-DOS, or DR-DOS or even Linux. The overriding point is this -- even with a
faster chip, you might not be getting a faster system.

>
>>taken into account, my compute 4 megabyte Falcon is much faster than my
>>roommate's 486 DX2-66 with 4 megabytes. Obviously that isn't a fair comparison
>
>Everyone who is using a PeeCee with only 4 megs is an idiot (sorry). You have

Actually he's not so stupid, but he is an average PC owner, and I own an
average Falcon, and therefore the average Falcon kicks the average PC's

butt-port.

>the eassiest way of using at least 8 megs. And 1 meg simm's aren't that
>expensive at all.

It is more expensive for four megabytes than the price difference between
a 486 and a 68040.

>
>>>How much are you willing to pay for 68040 upgrade for a Falcon? Compare this
>> Probably $200.00 Canadian. >:) I probably won't see it either though,
>
>You won't even get a single 68040 for that amount ...

But there is less difference in price between a 68040 and a 486 than it
costs to get four additional megabytes. And you would be an idiot to run any
486 operating system on less than 8 megabytes. (Apparently.)

I've seen working nets between a TT & Falcon, but unfortunately I cannot
remember what was the software. There's a program (shareware) called
DUEL (duet?) for networking via LAN - I saw it in a shareware review
section in a French ST-Magazin. But I have never actually found it in
ftp... They said it's a German program.

You must use the rocket-gun. Wait for the tyrannosaur to be outside, and
then shoot its head, by USING the gun, not SHOOTING !

You can get the lazer on another Robinson, who shoots you with. Better
drop your computer, otherwise he cut his, so you can't find him anymore. Kill him with
a lance or arrows.

The heavy lazer comes later...

I have tried to make sense of this thread for a while now. It says:

--> "Magic incompatibility list" <--

What *is* this magic? And what's the fuzz about 68040's ? I suggest that
you stop comparing clockspeeds and go for some benchmarking instead??

By the way; How long *time* will an integer division take on

1) a 68040 ?
2) a 486 ?

considering the variables could be in one of several places.
(Clockspeed of your choice :-)

>all the threading done by the server so I would like to
>use the server istead of download ing files.

That's what I did, but I couldn't find any as well. There are several newsreaders which do support NNTP in the original unix-versions, but none does with MintNet. So I compiled tin with NNTP-support. Seems to work fine by now, but I'll have to do some more testing before giving it away. Wait...

Try looking atari/Archivers on atari.archive.umich.edu (or, ideally, one
of our mirrors) for the appropriate de-archiver.

If you have questions, please send me mail.

>Uniterm was mah-vel-ous. It even offered SMOOTH scrolling!!! I don't
>know of any other terminal program that can do that.

I wholeheartedly agree! I have hooked up a 14400 bps modem to my good old
1040 STF and use it as a terminal to dial in to the university and read
mail and news. I *always* use Uniterm for that task. I have tested several
other terminal emulators, including CoNnect and Rufus, but none of them
even came close to Uniterm in terms of speed, features and functionality.
Most of them lacks VT220 support. They offer slick stuff like window
support, but as a result, the performance goes basically down the drain.
Uniterm features full X/Y-Modem and Kermit support plus dozens of
emulations. The Tektronix support is especially nifty: it allows me to
preview TeX files (via dvitotty) in decent quality on my good old SM124!
Bearing in mind that Uniterm is a) free, b) some seven to eight years old
and c) runs on the lowest common denominator of the ST series (even if
you only have a single-sided DD drive!), everybody should agree that this
is an outstanding and extremely useful piece of software!

In my opinion, there are only two draw-backs: a) the lack of Z-Modem support,
and b) that Simon doesn't develop the program further.

My congrats to Simon for this excellent program!! :-)

Message-ID: <3hj3c5$k22$2@mhade.production.compuserve.com>
Source record: 171688

The maximum RAM on a standard Falcon using standard Atari memory modules is 14 Megabytes.. (you have to install 16, but you only get to use 14).

(And yes, I know that using some mythical board from Germany you can install multi-gigabytes of RAM.. if you can find one and if you can afford it).

You can't use standard SIMMs.. the Atari memory boards are proprietary.

You could call Atari and ask about them, but the last person I talked with who called Atari about an Atari computer was shuffled around to a bunch of people who didn't even know Atari MADE computers, and was finally told to buy an IBM compatible computer (no kidding, that's what happened).

Better would be to call Toad Computers in Maryland.. they at least know what products Atari used to make. They may have the Atari 14 Meg ram board... also there is at least one third-party board that DOES let you use standard SIMMs.. Toad will probably know about that one too.

Unfortunately I can't find their phone number right offhand.. they also have a new WWW page which was just announced in c.s.a.st recently, in case you can find that article...

Be sitting down when they tell you the price of the memory board...

I have the following items for-sale
Buyer pays shipping
Price in U.S. Dollars

Roland M-240 24 channel line mixer, table top
(no EQ)

*4 effect sends per channel
*stereo rtns on three sends, fourth is mono but pannable
*rtns 1 & 2 have level switches
*4 bus in jacks
*fourth send can be pre or post fader
*the main outs provide both phone jacks and XLR connectors
*channels one & two can be used with mics
*dimensions: 26" X 11-5/16" X 3-7/16"
*pre-fader signal indicators
*headphone jack & volume control for monitoring
*channel panpots
*2-3/4" fader throw
*master peak meters
*individual channel peak/signal indicators
*in excellent condition (except for a few tape marks)
only used in my bedroom midi studio
*manual included
* $275
Buyer pays shipping

SOFTWARE FOR ATARI-ST:

GENWAVE Sample Editor
*lots of Features, including cross-fading,time conversion, pitch
transposition, filter drawing, will import Sound Designer files type I
*Covers these samplers: E-mu Emax/E 111/ SP-1200, P-2000/2/3000, Akai
S900(12 & 16bit), S950/S1000, Yamaha TX16W, Roland S50/S550/S330,
Korg DSS/DSM,T series, Frontal Lobe PCM Channel, Peavey DPM3,
Dynacord ADS/ADD, Casio FZ-1/10M, Ensoniq EPS, Midi
Sample Dump and more, (no SCSI support)
* $100

DR. T's XoR (Universal Editor/ Librarian)
* $75

DW/EX8000 Synth Editor
* $10

E-Magic's Logic 2.0 (& Logic Audio for the Falcon)

*One of the most comprehensive sequencer programs on the market,
included is Logic Audio 2.0 for the Falcon (Hard Disc Recording)
*Includes LOG-3 -- three additional midi outs, all manuals
* $200

Thanks for telling me! I just tried it and it works great when I use HSMODA5. However, I still need a third serial port and it would be great if someone could translate the short part about how to make the modification into english. I _think_ I understand how to do it, but I`m not going to cut any traces on my motherboard unless I`m 100% sure what I do.

Anyone, PLEASE!!!

BTW Harun, it looks like you have problems with your news-transport-program. It doesn`t know how to find your domain and can`t fill in the header correctly.

2157. syslogd setup for Mintnet

Newsgroup: comp.sys.atari.st
Date: 1995-02-12 08:10:59 UTC
From: tkk@uclink2.berkeley.edu
Message-ID: <3hkfqj$kn7@agate.berkeley.edu>
Source record: 171608

Could someone explain how the "syslogd" program from MintOS is supposed to be setup for MintNet to work? The README.MIN for "dip" says that syslogd must be running in order to make a slip connection, but when I run "syslogd" I get BUS address error messages or errors like "cannot create /dev/log". Does "syslogd" have to be executed from mint.cnf? How is syslog.conf supposed to be configured? I tried to look for some info in mintossc.tgz, but my gz06st program hangs trying to extract.

Thank you in advance.
tkk

KM>using it, quite happily! :^)

I have this CD here and it isnt the 50 german bucks worth. Some programms
are 2 or 3 times on it, for example PAULA (4x). The organization is chaotic
and the publisher Michael Wehner didn 't asked one author for permittment.

He has just downloaded a few BBS's in my neighbourhood.

If you are planing to buy a GOOD CD for the Atari try the Gemini or my
favourite CD-ROM AtariMega Archive CD. The Mega comes from England and
has 1.9 GB !! PD and Shareware compressed on it. Very good index.
They sell it in germany for about 60 german marks (30 US $)

Roger, why dont you find another site that has ftp or ncftp? Or
better still, why not ask your sysadmin about the possibility of
getting an ftp facility.

Clean up house time....
Anyone one want a bunch of machines for ol times sake.

I want to get rid of An Atari 1040 ST
Black And White monitor (SM124)
2 floppy drives 1 int, 1 ext (w switcher) missing power supply for external
Mouse
(no software) I hope you have some.
It works great though.

IBM 286 12MHz
1 meg ram
1 3.5" & 5.25" 1.44 and 1.2 meg drives
40 meg HD
built in VGA card
no monitor
2400 baud int. modem
comes with mouse (new)
and keyboard.

Amiga1000
512k ram
internal 880k floppy drive
keyboard, mouse, joystick
1 external floppy 880k drive
all power cords,
few software titles
kickstart and workbench 1.3

All I want is someone to pick it all up, cost to much to ship
and pay around $350.00 for all of it.
or trade me something, andything of close value...

Hi folks. Am new to this conference... have been reading it for a
couple of weeks.

I am seriously considering purchasing a BROTHER HL 630 Laser printer.

I need to know:

1. Are printer drivers available to run from an Atari 1040 STe
with Pagestream, Wordwriter, etc.

2. What is the best price/sale price anyone has seen currently?
Especially Southern Ontario/Canada or convert to Canadian
dollars if possible.

3. Anyone with an Atari running this Laser printer, please
write me direct to: jim.gain@primetime.org or in
ATARI_ST, or Atari-ST, or this conference.

Please reply soon... I am in desperate need of making this purchase
soon! THANKS!

Butler James has this nice little feature, and you get a number of other nice things, too. Unfortunately, the last version I know of (1.6) nicely kills of MultiTOS.

From: richard@stingray.manawatu.gen.nz
Message-ID: <FBNJBIVAUp@stingray.manawatu.gen.nz>
Source record: 171616
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Does anyone know how people that use the cart. port, get around having no R/!W line? And also, for that matter, why is there no address 0 line connected? So you're limited to 1/2 the area?

Are there specific parts of memory which are best to use for cart addressing? I haven't taken much interest in absolute memory addresses (except for colour registers a couple of years ago), since my 8bit atari (which I am now using more often than my ST!)

Any info would be most appreciated.

Thanks,
Richard =8-]

Source record: 171617

>A friend of mine has a interface that connects to the hard disk and
>makes it a SCSI compatible disk. After that he connected a SCSI to DMA
>interface (the one from ICD) and that was it!

That SCSI-MFM controller probably is an Adaptec A4000. Atari used it in the SH204 drive, which had an Atari DMA-to-SCSI board, the A4000 and either a Seagate ST225 or Tandon 262 MFM drive.

> Of course all that overhead slows down the accesses so i suggest that
>you take a SCSI hard disk. It is cheaper that take all this trouble.

It's not the overhead, it's the slow MFM drives. MFM drives have a constant sectors per second rate (it's either 17 sectors per track at 3600 rpm or 20 at 3000 rpm), giving a maximum raw throughput of about 500 KB/s. For nowadays, that's dead slow.

bye, Peter

> wood..

Best of luck!

> Well what I am after is a list of the better PD games, colour/mono
> that will run from a HD on a ST/STE etc...

If you want me to I could send you my Atari software catalogue. There are quite a few PD/SW mono games there, and the price per disk is only 1.70 UK Pounds (approx).

Seems like you're from New Zeeland - you're practically sitting under my feet then!

> One that I did not loose was Starball, this would be one of the best
> around..

Ever tried Swedish pinball game Obsession? Rated 98% in one UK Atari magazine, and yes - it is that good! Available from my catalogue at 25 UK Pounds.

[End of commercia]

Up here we have -2 degrees Celsius but no snow. What's it like down there -summer?

Yours sincerely

Yes I do know this but the BIG problem is those Atari file extentions,
like .TOS etc, you can't access them, but you can via Gopher....

Files show up differently depending on witch was you access these sites..

It seems that Ken is talking about *real* memory units, ie what the rest
of the computing world call chips which manage memory to allow protection
and virtual memory.

Bazza OTOH is talking about the chip Atari grandiously called a MMU. Its
just a pity it doesn't do everything its name implies.

:-(

Roland.

> think those who did were unsure if the ST has one. Anyone know if

The ST has a chip which in Atari speek is called the MMU. If its faulty
or even just a little under spec then this might be the problem.

However when people say 'you need an MMU to use this software' they don't
mean this Atari chip. They mean the proper MMU built into the 68030 and
above - or the Motorola MMU chip which can be used in conjuction with (I
think) 68010 upwards. Most commonly found with 68020s like in the very first
MAC 2 (it was optional there - but ISTR there was a socket for it).

:-)

Roland.

In <3hgkkh$k70@newsbf02.news.aol.com> alfasoldt@aol.com (Al Fasoldt) writes:

>> Does anybody know if softpc will work with dos 5.0 on a TT4?

>Yes, it will, and with DOS 6.x, too. But Hutch makes a good point. I *do*
>wonder, though, what the status of that software is.

Well, I formatted a 720K floppy with the /s switch on my girlfriend's
PC, but starting up SOFTPC always gives me an error about
"d:\softpc\c_drive.hdf" not found - If I make a dummy file with that
name, it complains that is hasn't got the right format. So how can I
boot? The (short) readme says that I should be able to boot with an
MS-DOS bootdisk (3.20 and 3.30 succesfully tried) but I can't find
anybody with such an old version. And you say it works with the newer
ones...

What am I doing wrong?

And on legal terms, if I FORMAT /S a floppy on someone else's PC, can
I use that as bootdisk at home?

Regards,

Time out guys...as the original poster with an FDHD equipped Mac (Sys 7.1) on my desk, I know I can read, write, and format 720K DOS disks on the Mac that work just fine on my 1040 at home...that never was the problem. In fact my Mac is a little fussier that the ST, so I format disks on the Mac just to make sure they will be readable on both machines.

Depends what style game you like. Personally I find the following good:-

Colour Clash - great puzzle game with cute little chameleons
Sim Pig - brilliant little sim city clone
Fatemaster - RPG sort of game quite like the Zelda series on the SNES
Grandad 1 & 2 - both classic arcade/adventure games
Utopos - brilliant 'Oids' clone (without the oids!)

There are no doubt hundreds others...

I have the following items for-sale
Buyer pays shipping
Price in U.S. Dollars

Roland M-240 24 channel line mixer, table top
(no EQ)

*4 effect sends per channel
*stereo rtns on three sends, fourth is mono but pannable
*rtns 1 & 2 have level switches
*4 bus in jacks
*fourth send can be pre or post fader
*the main outs provide both phone jacks and XLR connectors
*channels one & two can be used with mics
*dimensions: 26" X 11-5/16" X 3-7/16"
*pre-fader signal indicators
*headphone jack & volume control for monitoring
*channel panpots
*2-3/4" fader throw
*master peak meters
*individual channel peak/signal indicators
*in excellent condition (except for a few tape marks)
only used in my bedroom midi studio
*manual included
* $275
Buyer pays shipping

SOFTWARE FOR ATARI-ST:

GENWAVE Sample Editor
*lots of Features, including cross-fading,time conversion, pitch
transposition, filter drawing, will import Sound Designer files type I
*Covers these samplers: E-mu Emax/E 111/ SP-1200, P-2000/2/3000, Akai
S900(12 & 16bit), S950/S1000, Yamaha TX16W, Roland S50/S550/S330,
Korg DSS/DSM,T series, Frontal Lobe PCM Channel, Peavey DPM3,
Dynacord ADS/ADD, Casio FZ-1/10M, Ensoniq EPS, Midi
Sample Dump and more, (no SCSI support)
* $100

DR. T's XoR (Universal Editor/ Librarian)
* $75

DW/EX8000 Synth Editor
* $10

E-Magic's Logic 2.0 (& Logic Audio for the Falcon)

*One of the most comprehensive sequencer programs on the market,
included is Logic Audio 2.0 for the Falcon (Hard Disc Recording)
*Includes LOG-3 -- three additional midi outs, all manuals
* $200

2189. Falcon bombs with HD disks

Newsgroup: comp.sys.atari.st
Date: 1995-02-13 18:22:26 UTC
From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3ho812$g49@bs33n.staffs.ac.uk>
Source record: 171640

When copying as many disks as I do on my Falcon I was interested to note a small problem I came across. With a high density disk that has been PC formatted I simply could not copy a folder onto that disk - it would bomb out. This happened when using Kobold or any other program, even the Desktop. I have TOS 4.02, I got a friend with TOS 4.01 to test this and the same happened for him. Copying files is fine, either single or multiple, but copying a FOLDER (either empty or with files inside) just made the machine crash.

There's got to be a patch program for this rather odd little problem and don't say format the disk with the GEM desktop because I have to copy hundreds of disks and therefore buy them ready formatted. Thanks..

'A bemused' RiCH

In <3hbflq$k25@newsbf02.news.aol.com> ERCORP wrote:

>Will Magic Mac run on a 68030 Powerbook Duo 210 or 230.

The faq says

Q: Which computers work with MagiCMac?
A: MagiCMac works with all Apple Macintosh computers with a 68030 or 68040 processor. For example, Quadra 700, PowerBook 150, Duo 270c, Performa 475 or 630. You should have at least 4 MB RAM available. With this configuration you will only have 1.5 MB under MagiCMac. For convenient working we recommend 8 MB RAM.

so I'd say a 210 or 230 will be ok as well.

In a continuing silly argument about whether or not Motorola's 68040
chips are -really- internally clock-doubled in the same fashion as
Intel's 486 series chips, kim@dksoft.ping.dk (Kim Andersen) wrote:

>>Remember guys... the truth ain't always what you read in the funny papers
>>-or- in those glossy ads. Hmmm... not much difference though. ;-)
>
>And what is suppose to be the difference in what you tell us, and what we
>read. Are you telling what i read isn't the truth ?

Quite honestly, Kim, I couldn't really care less WHAT or WHO you believe
and I most imagine that Hendrik feels the same way. And none of what your
buddy wrote should be considered surprising by any informed technician.

My sole disagreement in all this was that the 68040 is not clock-doubled
in the same *fashion* as the Intel chips. With that single exception, I
concur with your friends long but informative tirade about the beauty of
the 68040. Hey, I own one and DO think it's a great chip.

I think the likelihood of us ever seeing a 68040 Falcon built by Atari
is somewhere between slim and none. But that's another story, of course.

I know what the truth is in this regard, and that's gratification enough
for me, especially on a nonsensical topic such as this where it doesn't
really matter WHO is right in the grand scheme of things.

It just doesn't pass my "So What?" test, ya know? :)

>HM> Motorola "M") came out late 1994.
>Sorry, i meant Motorola's 040ï¿½s only. I have no idea about others.

See, you have no idea about the different steppings of this particular cpu.

I' _am_ talking about the 68040 here! But there are different revisions
available. The XC-type is used and selled until the silicon is thoroughly
tested (in the field. Apple has 'em in their MAC's) and them it is "rewarded"
the Motorola-"M".

2203. Adaptec+ and hd problem

Newsgroup: comp.sys.atari.st
Date: 1995-02-13 21:31:25 UTC
From: foltin@cherokee.nsuok.edu
Message-ID: <D3yJsE.L5M@cherokee.nsuok.edu>
Source record: 171554

Help, again! This time with a hard drive problem.
I have the following system:
stock 520ST
Atari dsdd drive
Adaptec+ adscsi
Adaptec software 6.5.5
Sony SRD 2040A scsi drive (came out of a mac or apple)
IBM 150watt power supply

The system recognizes the drive and gives me some info on
buffers, the clock. However, I cannot find a way to reformat the
drive from mac to gem partitions.
ICD's hdutils brings up themenues and the dialog boxes, but
nothing is highlighted to choose on the zero directories dialog
box, for instance.

When I try to run ICDFMT, the system responds: Stack overruns
heap. What does that mean?

I tried to call ICD, but am unable to penetrate the silicon
barrier to get to a human being.
What is their e-mail address?

Thanks for any help that y'all can give. I am just so frustrated
by the fact that I am a gnats hair way from hooking up my HD.

Thanks a bunch.

Bela Foltin

Source record: 171555

Hullo there...

Okay, you may have thought that I was going to do an HTML->1st Word converter. I still may, but having looked at ST-Guide seriously, I think it is the best choice.

So, it won't cope with graphics, and it won't be realtime, but so far the program is going slowly, but well. As previously thought, the formatting routine is the tricky bit.

Just out of interest, how many levels of indent do you think it should be able to cope with? Say every indent takes up 5 chars, I could have about 20... Sound good?

BTW I am definitely not thinking of doing an ST-Guide->HTML converter. Too tricky.

Thanks for all your input, I'll keep working at it (slowly...)

Cheers, Leon.

From: bryonm@omnifest.uwm.edu
Message-ID: <3hor1f$h70@omnifest.uwm.edu>
Source record: 171558

Hello,

I am wondering if i could get the pinout signals for an atari SC1224
monotor?

Please mail me with suggjestions, i cannot see anything if someone posts
publicly.
QUIT

thanks,

Bryon Morisette

2208. Which TOS version is best?

Newsgroup: comp.sys.atari.st
Date: 1995-02-14 00:09:41 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950213160634.20583F-100000@PEAK.ORG>
Source record: 171559

I've heard rumors that some of the older games won't work with a new version of TOS. Does anybody know if there's any truth to that rumor? I have a bunch of older games that I'd like to run, but at the same rate, it would be nice to upgrade to the latest version fo TOS, for increased hard drive performance.

Which version of TOS begins the incompatibilites, if any? Is TOS 1.04 (?? I think that's the #) TOTALLY compatible with 1.0? Is there any way to install more than one version of TOS and switch between them?

Is there a TOS FAQ that might answer my questions?

Thanks in advance.

James

2209. ST Clock wanted.

Newsgroup: comp.sys.atari.st
Date: 1995-02-14 00:12:18 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950213160957.20583G-100000@PEAK.ORG>
Source record: 171560

I'd like to find a clock for the old 520ST.

Seems like WAAAAAAY back in the beginning, there was the Logichron cartridge clock, and there were also some solutions that went INSIDE the machine, leaving the cart port (and desk space) free and clean.

I think they might have gone in a ROM socket, under a ROM. Does anybody know what's up with the old ROM socket clocks? I think it would be grand to have it INSIDE the machine. I have a Toad Computers catalog, but all I see there is a cartridge clock.

Anybody have a clock they'd like to sell, by the way?

James

Buyer pays shipping
Price in U.S. Dollars

SOFTWARE FOR ATARI-ST:

GENWAVE Sample Editor
*lots of Features, including cross-fading,time conversion, pitch
transposition, filter drawing, will import Sound Designer files type I
*Covers these samplers: E-mu Emax/E 111/ SP-1200, P-2000/2/3000, Akai
S900(12 & 16bit), S950/S1000, Yamaha TX16W, Roland S50/S550/S330,
Korg DSS/DSM,T series, Frontal Lobe PCM Channel, Peavey DPM3,
Dynacord ADS/ADD, Casio FZ-1/10M, Ensoniq EPS, Midi
Sample Dump and more, (no SCSI support)
* $100

DR. T's XoR (Universal Editor/ Librarian)
* $75

DW/EX8000 Synth Editor
* $10

E-Magic's Logic 2.0 (& Logic Audio for the Falcon)

*One of the most comprehensive sequencer programs on the market,
included is Logic Audio 2.0 for the Falcon (Hard Disc Recording)
*Includes LOG-3 -- three additional midi outs, all manuals
* $200

I would like to point out once and for all.

ATARI IS NOT OUT OF COMPUTER BUSINESS AT THIS TIME!!

So I guess you're right :-)

They are still producing Falcon's, we can get new machines instantly here in Europe.
Atari do NOT have any further plans on cutting the production.

Keep Cool and Flying...

All STs have an MMU (but limited to 4Mb due to, perhaps, lack of foresight).
More powerful Ataris, like the TT030 and Falcon030, have later versions of
the 68000 CPU used in the ST, with on board MMUs.

|> Thanks.merci
|> -ken

ET4000 is the name of an actual graphics processor made by Tsenglabs (?). It's quite common, being in used in TKR's Crazy Dots and also many PC cards.

We don't hear much about Cyrel products in the UK :(but the top Atari dealer here,
System Solutions, imports from Germany the Matrix TC1208E. This is a 32-bit totally
self contained VME board (unlike the NOVA series which are a separate box with a
ribbon cable terminating in a 'dummy' card that goes into your VMEbus) running at, I think,
32MHz, with a wide range of screen frequencies (120MHz bandwidth ? I can't remember) and
resolutions. As far as I know it is the Rolls Royce of Atari graphics cards, and here
costs 999GBP. Hope this helps.

S.Lai

P.S. Crazy Dots was the first card to be approved by DMC for use with Calamus SL but sadly
TKR don't make them any more.

>help.

The BSD socket library, which MiNTnet is based on, is not restricted to IP, it should be possible to use it with a Novell network (Novell's own socket lib is fairly closely modelled on the BSD ones) However using Appletalk devices would not be as simple as that as the protocols for file sharing etc would need porting, and the protocols normally used over IP would not be of any use.

If it's just one mac you want to connect to and not an existing network it would be easier just to set up a SLIP connection, possibly using the localtalk connector. I don't know of any software for the mac to set up such a connection (a SLIP connection that doesn't assume you have to dial someone first) but I'm sure it exists.

It _can_ have user restrictions; so can gopher. Depends on how its set
up, AFAIK.

Wasn't httpd designed to put a low load on the machine? I do see a lot
of sites collapsing under the WWW load though; probably using cheap
clones running FreeBSD or Linux. :-)

>(Clockspeed of your choice :-)

If you're going to do that, you should include a whole sequence to move
the data into registers; Intel chips have very few registers, and you
can only do certain operations (like division) on certain registers.

Special-purpose registers and segments are completely idiotic.

Charlie Mike (limchung@iscs.nus.sg) posted:
: Hi,
: Is there any hardware circuitry that converts the video signal from the
: ST into a composite signal? Can someone please point me to any relevant
: source on the net?

On STE/STFM/STM machines there's already a composite out on the monitor port.

Is that any use?

Otherwise I'm not sure yet how to convert an RGB signal into a composite:
I think it needs to be modulated first. You can get modulators fairly
cheaply if it's important.

Paul.

They simply use the information on the address lines instead.
The address 0 line doesn't exists in the ST. This is the lsb of the
address bus. The lack of line 0 prevents you from accessing memory on
odd addresses.

> Are there specific parts of memory which are best to use for cart addressing?
> I haven't taken much interest in absolute memory addresses (except for
> colour registers a couple of years ago), since my 8bit atari (which I am now
> using more often than my ST!)

The cartridge port of the ST is located in the $FA0000-$FBFFFF memory area.
The first longword should be a set value from which the OS gets the type
of cartridge (Autoboot or Application (GEM-accessible))

>There isn't an address 0 line on the 68000 at all; it's a 16 bit processor. To

No there isn't an a0, but that is just the way they did it. I believe that
68030 does have a0.

>do single byte accesses there is a line to indicate that it is a byte access
>and another to specify which byte (effectively an A0 although it's not called

Not exactly true, what you actually get is two data strobes instead of one -
UDS (upper byte) & LDS (lower byte). On even reads, UDS & LDS go at the same
time, reading both bytes at once. On odd reads, only UDS is strobed (hense
the limitation to reading bytes only from odd addresses)).

>that) but I don't know whether they're on the cartridge port.

Yes they are

>As for the R/!W line, you can't get round this, there is no good way of
>writing to the port. If all you want to do is trigger something like a scan,

Yes, you could download a demoversion from ASH's mailbox in Germany. The number
could be found in one of the last ST-Computer.)

But I don't know in how far it is limited and which functions are disabled.

HM> Kim won't buy it.

Hang on here. The bet is wether or not the Motorola 68040 is doubble clock,
as it's your original statement.

HM> See, you have no idea about the different steppings of this particular cpu.

To be honest, i havn't got much technical idea about chips in general. What
i'm stating here is only what i've heard from people i know.
This is not said to excuse anything, cause i trust those people enough to
make a bet 8-)

HM>

I could try get the phonenumber for Motorola here in Denmark, (would only
take me a few minutes), but that'll still be coming from me, so i guess
you won't buy that one.

>
>It just doesn't pass my "So What?" test, ya know? :)
>

I have a feeling you and Hendrik is talking about something different from
my statement. The question is wether or not the 68040 is doubble clocked, and
nothing about how it's doubble clocked compared to an Intel 486.
So if you want a bet about _how_ it's doubble clocked, then it's fine with
me, but i'll probably loose, as i have no idea and it would only be a guess.

I'm not backing out of the bet here, i'm just saying where i'd put my bet.

>
I'm beginning to regret actually saying anything here, but what the heck.
To start with, I know it is possible to rename and d/l using other systems,
but why let that in the way of a good argument?

Secondly, I said "exotic" not expensive. I know all the various options
that I mentioned are free; what makes them exotic is that minix, mint, et al
require that I effectively replace my complete OS and learn a new language
before I do anything else. Judging by the many problems posted here by
various users, it ain't easy. And if anyone can tell me how to set up a
partition that CAN handle long filenames without doing that, I'd be pleased
to hear how.

It's bad enought having to convert from the GEM GUI (which is one of the
reasons I got an ST in the first place) to a cli/keyboard screen operation
to get into the net. Just because "them upstairs" decided that the ST is a
poor machine and anything big blue makes MUST be good doesn't mean that I

have to agree. You lot obviously don't else you wouldn't be here. It's obvious from the addresses that many of you out there are computer specialists at universities and commercial organisations. Unix is probably as familiar as English to you; to me it's Swahili. I had hoped, in starting the argument, to stimulate a few intelligent replies (I got some) not a flame war. All I ask is that a few of you who are considerably more expert than many of us, remember that not everyone is as bright or as knowledgeable as you. I am, I suppose, a "newbie" in net terms, and it's probably my own fault for not making that clear. However, in the past I have always found the Atari userbase to be both friendly and helpful to the less knowledgeable - or is it academic life that changes one? I never got that far, so I can't tell.

I've tried to help others in various areas where I can since getting net access. Is there any chance of civility and help myself if I ask questions on other matters in relevant threads, or will I just get flamed again? rsh must either have a very thick skin or be very dumb to still keep posting the way he does and take all the flak that comes his way. I was raised differently.

thanks anyway

[some specs deleted]

>And anyway, it's internally double-clocked - A 32Mhz 68040 is actually
>ticking away at 64Mhz.

This is WRONG!

The 68040 uses the BLCK for the floating point unit and the instruction unit.
Those two determine the raw power of this cpu (or any other for that matter).

There is a PCLK, which is exactly BLCK * 2, but this is only used for some
internal logic and therfore does not influence the speed.

> Any ideas where I can get GFA Basic v2.0? On a ftp site somewhere perchance?

The GFA BASIC 2.0 interpreter has been in the public domain for some time now and should be available on multiple ftp sites. Sorry that I cannot tell you which ftp site, however.

I would -strongly- suggest, however, that you try to find the compiler for GFA 3.5 instead of reverting to 2.0. GFA 3.x was a quantum leap ahead of 2.0 in terms of capability and performance. You see it for sale in the newsgroups from time to time. As a matter of fact, I have an extra copy myself (with docs) you could have for cheap. Postage to NZ might be a bit dear, however, so you would be better to check around there and in Oz.

In a previous article, jim.gain@primetime.org (Jim Gain) wrote:

> 1. Are printer drivers available to run from an Atari 1040 STe
> with Pagestream, Wordwriter, etc.

I'm not familiar with the Brother line of laser printers but if it supports HP Laserjet emulation you should be OK. HP PCL is the 'defacto' printer control language for non-Postscript laser printers and most all word processors and dtp packages include HP printer drivers. I'd be very surprised if Pagestream and/or Wordwriter did not.

> 2. What is the best price/sale price anyone has seen currently?

Having never heard of this printer before, I can't help you. But you should look around and ask over in misc.forsale.computers.printers as you might find some information there.

2242. NOS (KA9Q) problems

Newsgroup: comp.sys.atari.st
Date: 1995-02-14 22:42:08 UTC
From: barheath@heathen.demon.co.uk
Message-ID: <950214Z224208.377barheath@heathen.demon.co.uk>
Source record: 171593

Having tried unsuccessfully to get some useful information from the demon.ip.support.atari group, can anyone here help me? I am experiencing a few problems with the NOS suite on my ST and I could do with some advice.

First: How can I get NOS to run with Geneva? I've set it up according to the Geneva manual, but all that happens is that it treats the call from demon.tos to the next module as a program termination, and will not load the module. Actually, that's not quite right -it did load the mailer once, but as soon as I got the "Press a key " prompt (and did) it went into a continuous loop that I could only break with a reset. I contacted Gribnif, but Dan Wilga doesn't know the NOS suite, so couldn't give me a lot of help. Any ideas in netland?

Second: Why does the suite give a two bomb crash if I select a posting that I've just made to Usenet? Literally, if I post a follow-up or a reply to a posting, then read it (sometimes inadvertently) as soon as I exit the thread, I get a two bomb crash. 9 times out of 10 Neodesk will recover it, but sometimes with a further four bombs. Even then I have to exit to the desktop to delete the.LCK files before I can re load Snews.

Third: How do I create a usable Kill file? The docs are not very clear on this, and although I have tried, all I got was bombs or lockups when I tried to log on. What parameters CAN the K-file accept, what MUST it have, and what may I NOT do?

Regular setup is: STe 4Mb, TOS 1.62, 170Mb Hard disk, mono, no h/w mods. S/w is NOS 0.42, Snews 1.90, Mailer 1.9 and whichever version of KA9Q et al was on the demon ftp server at the end of January. This all runs under NeoDesk 3.04, plus HSmodem4, (I've got 5, but Hendrik says it's bugged so I've not installed it) automouse and maccel3. DAs are NeoQueue, NeoControl, XControl, NeoTrashcan.

Any useful ideas would be most welcome - there must be someone out there who knows this setup better than me!

thank in advance
bazza

I recently got the cartridge clock from Toad. The one I received was the Eureka clock, not the Alpha whatever clock listed in their catalog. This is important because the Eureka clock is a "pass-through" cartridge, which let's you plug another cartridge into the cartridge. So if you cannot find an internal clock, this might be an acceptable solution, although not aesthetically pleasing, still allowing you to use other cartridges at the same time. Hope this helps,
-John Stanmeyer

Source record: 171501

I've just inherited an Atari 1040ST. I hope to eventually use it to set up a small midi studio that will make my electric bass practicing more enjoyable. But first I will have to learn my way around the machine. A few quick questions:

1. What is the small superscript "f" that appears on the packing box? the model seems to be 1040ST <f>. What does it stand for.

2. For modest operations with a program like band in a box, will I need to get a second disk drive?

3. Can a non-Atari Hard-drive be added to the system? If so, what can or cannot be added.

4. Can additional RAM be added easily? If so, how much, and is it really needed given the modest midi functions I have planned for the machine

That's it for now. I would definitely appreciate any help that anyone could offer. E-mail to bqz6@musicb.mcgill.ca or Glen.Luczko@medspec.com would be appreciated. Thanx for shedding some light on this most mysteri ous of new toys... I'm gonna have fun with this thing once I figure it out! Thanx for your help...

Later,

>National University of Singapore

If you have a 1040STf or a Mega ST2 like I do, you will need a VideoKey made by Practical Solutions in order to connect the ST to a Composite Monitor. The bad news is that Practical Solutions is long dead. Perhaps TOAD might have one VideoKey collecting dust on some long lost shelf at the back of the store.

Mike Wasinger (mwasinge@nyx.cs.du.edu) wrote:
> (1) What signals are on the 19 pin line?
> ASCI ? (What is ASCI and how is it different than SCSI?)

ACSI, yes. ACSI is a trimmed-down SCSI bus. It lacks a few important
features (arbitration, parity, disconnect/reconnect,...).

> (2) What is the 50 pin cable?

SCSI.

> (3) What does that small board do, and what is it called?

Host adapter. It converts the ACSI stuff to SCSI and vice versa.

> (4) What is the large board over the drive? Does it convert
> SCSI to MFM or what?

Yes.

> What is the board called?

This is a SCSI-to-ST506 controller; in the SH204 it's an
Adaptec 4000A.

> It has
> an extra ribbon cable header. Is this used to hook up
> another drive as I have heard is possible with the
> SH204?

Yes. You can add a second ST506 drive and use as LUN 1.
(The first drive is LUN 0.)

> (5) How could I hook up an unused SCSI drive (from an old
> Mac) into this system? At what point does it get attached?

Attach it to the host adapter. You will no longer need the Adaptec
anymore.

> (6) I read in an article about MacMagic that this new Mac based
> ST emulator could read/write to Atari HD's hooked up to the
> Mac's SCSI port. Does this mean that the 19pin port on the
> back of the SH204 is true SCSI?

No, it's ACSI. What the article probably means is that you can
take the SCSI drive out of a Atari HD and hook it up to the Mac.
In the case of a Falcon or TT, Atari HD even *are* SCSI drives.

> (7) Will only MFM drives work attached to the large board?

You can also try RLL drives as long as the interface is ST506/412.

> What drive mechanisms will work with the SH204 controller
> board? Where can I find the format parameters for use in
> Atari's format program datafile WINCAP?

Virtually any MFM drive with ST506/412 interface will work fine.
You need to take the format parameters from the drive's spec sheet.

> (8) What are the recommended means of speeding up HD I/O given
> that I am using TOS 1.0 in ROM. What PD programs are helpful.
> How much is TOS 1.4, and where can I find it?

Get TOS 2.06. If you cannot affort it now, get at least FATSPEED
from atari.archive.umich.edu. TOS 2.06, however, is much preferable
especially since you intend to upgrade your ST with "a faster chip"
which may well be a 68020 or 68030. TOS 1.04 won't work with
anything else than a plain 68000.

>better still, why not ask your sysadmin about the possibility of
>getting an ftp facility.

We had FTP but the teenagers stuffed it up, it is a free system,
but they left Gopher and have added the Lynx Web Browser..

I don't have the money to pay for a real system, they charge
$10nz per meg here on average for FTP plus $150 per year membership,
and that is for a shell account..

This service is a bit limited but its is free....

The problem with most sites is that they are not set up for a Web Browser
or a Gopher client when using Atari file extentions...

Any way I did get that file down via a mail server but its stuffed,
it does not even Undecode...

Distribution of the Jaguar system is VERY spotty around the country.

The West coast seems to have the best representation of dealers carrying the products.

Atari released a Press Release a few months ago which said that Toys 'R US would be carrying the Jaguar in 300 of its stores. I don't know how many TRU stores there are in the US, but I do know the one near me doesn't carry the Jaguar.

Electronics Boutique is another chain which usually carrys the Jag (the EB near me has one) and Babbages's is another (the Babbages near me doesn't carry the Jaguar).

Tower Records, a music chain, is another place to look (the Tower near me had four Jaguars stacked on the floor last time I was there).

I still haven't seen a working Jaguar display in a store. I do understand that the last Atari Computer dealer I know about in the state of Michigan has one on display (an hour and a half round trip drive), but I haven't been in that area of Detroit for a while.

You can always order a Jaguar direct from Atari...

Er, MagiC is NOT a Mac emulator, it's a replacement multi-tasking OS, which
aims to be TOS compatible. (And the ST version seems to fairly successful
in this aim).

>Does anyone know the maximum length you can have a parallel printer cable?

I looked through all my reference material and couldn't find the specification (I know it's there somewhere, and I'll probably find it after I log off), but I believe it's something like 16 feet.

Also, some STs had problems with weak parallel ports (some couldn't drive certain brands of printers without using a printer buffer device), so trying to stretch the maximum might not work reliably.

There are relatively inexpensive devices you can insert in a parallel cable to increase the usable distance... you might want to check with a well-stocked computer supplies store or catalog.

>"d:\softpc\c_drive.hdf" not found - If I make a dummy file with that

Just keep clicking cancel, or ok or whatever the button in the warning
dialog is, and it eventually goes away.

Now use create new drive d to create an hdf file. Use MSDOS to format
the file & make it bootable, then set drive c to point to it & restart
SOFTPC. Now it will boot from the hdf file instead of floppy & will not
complain about it at all.

>What am I doing wrong?

See above...

>And on legal terms, if I FORMAT /S a floppy on someone else's PC, can
>I use that as bootdisk at home?

If you insist on using SoftPC, that's the least of you worries....
(old DOS5 disc sets approx 5.00 (UK), SoftPC on other platforms, 20 times
that price or more, lawsuits, etc).

Craig.
(I must point out that I do not condone the use of pirate versions of softPC)

>The main DeskTopper box looks really tacky, though.

I thought that would be the case, but I did see an advert for the Duo-Docker
in ST-Review, sold by Gastiener. What's it like ? Costs less than a
DeskTopper & comes with a Cherry keyboard as standard, and a 2.5" -> 3.5"
adaptor cable so you can use 3.5" IDE drives instead of (expensive) 2.5" ones.

Sounds nice - but what does it actually look like ?
(theres an ST version as well that comes with a SCSI interface)

Craig.

I have a question for all of you AstroPanic players out there. I believe I have patched the problem that limited how many directories down AstroPanic could be in, but I also have a number of other improvements I still need to do. But unfortunately time is going to be a rare commodity for me for the next few weeks. So should I a.) release a rev. E, that will mainly just patch this bug or b.) wait on it till I get my other improvements done.

I leave it up to you. Let me know. I'll take no answers as a wait answer.

Hello Henrik,

HLW>They are still producing Falcon's, we can get new machines instantly
HLW>here in Europe. Atari do NOT have any further plans on cutting the
HLW>production.
Are you sure?

Here In Germany, in fact in my neighbour town has a big Atari Dealer gave up
selling Atari Computers and this in a city with many atari computers.

Greetings
. . .

Atari still produces the Falcon030. And a german company are soon releasing the Falcon-MkII. And yes Atari certianly exist.
There are coming a lot of interesting software/hardware for the Falcon these days. And we can also look forward to see a lot of new games for it in the spring.

Keep Cool and Flying...

m> Questions about building a memory upgrade board using SIMMs.

One of the ultimate ironies of the Atari ST system is that
the computer is not upgradeable. I'm sure that many people from
other computer platforms would be very quick to agree. Many
others, such as Dave Small, and probably the people at ICD INC
would take some small exception to this idea. I too would have to
take a minor exception. Because of the relatively closed
architecture of the ST this computer system has become a hackers
heaven. It is with this in mind that I have written this recount
of my experiences using SIMMs to upgrade STs to 2 1/2 megs.

It seems like each time I read an article about upgrades
there is a long warning about warranties and technical competence.
Why should I care if you ruin your computer? As far as your
warranty goes, if you remove the screws on the bottom your warranty
is void. My upgrade will cause your warranty to explode and
possibly ruin your computer desk in the process. There is the
small reminder that since the warranty is only 90 days in the
first place, the odds of your warranty being valid at this time
are nill. One small consolation, if you do ruin your computer
while attempting this upgrade you can always buy an STe and use
the SIMMs there.

The reasons I developed this particular style of upgrade are
two fold. The first is that I just wanted to see if I could do
it. The second has to do with my personal feelings about sockets
that plug into existing chip sockets and cause permanent damage.

There are a couple of advantages to my upgrade techniques.
1} I use SIMMs, which are noted for their reliability. 2} The
upgrade requires only two minor jumper/foil cuts. 3} All
connections are soldered which means no sockets to ruin and if
properly done provides extremely reliable long term operation.
```

Since you are probably going to try this anyway, you should go ahead and get yourself a pair of 1 meg x 8 SIMMs. If you should happen to get the 1 meg x 9 SIMMs, that is ok too. The speed isn't that important, but it is hard to find a set of SIMMs these days slower than 100ns anyway. While you are in the getting mode, get yourself a few feet of 28 gauge Kevlar wire such is used for wire wrapping. You will also need a decent temperature controlled soldering iron running between 750 and 800 degrees. Take your 25 watt Radio Shack type iron and throw it away while you are at it. Those small and unregulated irons are a good source of just the right types of static known for killing CMOS circuitry dead. I should also mention the fact that the longer a soldering iron remains on the circuit board, the greater the chances are that you will begin destroying the foil patterns.

The major problem I have encountered while upgrading STs is the numerous version revisions. There are no fewer than 6 different styles of mother boards and many of them use different circuit symbols for the various components. For this reason I will not be referring to any of the components by their circuit symbols. All references will be by component name, such as the MMU, or the upper and lower RAM banks. I simply have to assume you know what your are doing.

I begin the upgrade by removing the mother board from the computer and placing in on an anti-static workbench. Depending on the model of computer, the upper bank of ram chips must be removed. By upper bank I mean the row of chips connected to the CAS1, and RAS1 lines from the MMU chip. You may verify this by measuring from pins 18, 21, and 22 of the MMU chip. CAS1 H = 22, CAS1 L = 21, and RAS1 = 18. The corresponding locations of the CAS and RAS lines on the ram chips are pins 15 for CAS and 4 for RAS.

The ST uses two rows and four columns of ram chips in their memory addressing scheme. The Row Address Strobes (RAS) are labeled RAS1 and RAS0, and the Column Address Strobes (CAS) are labeled CAS1 H, CAS1 L, CAS0 H, and CAS0 L where the H and L stand for High and Low. All the lines using the 1 are related to the the upper row and the lines labeled with the 0 are used in the lower row.

You will probably not find the above mentioned labels printed on your particular mother board. The only time I remember seeing this done was on the 520ST with modulator. Don't expect it.

If you are wanting to do this upgrade on the early 520 you should remove the entire set of ram chips. Your final upgrade will be 2 megs instead of 2.5. There is just no clean way to install all the wiring needed to installed chips.

Once the ram chips are removed it is time to mount the SIMMs and prepare the wiring. On the machines where the ram chips are

mounted under the keyboard, there is a good place to mount the SIMMs right above the upper bank of ram chips. I use strips of double sided adhesive foam which I attach to the back of one of the SIMMs. I then stick this SIMM to the mother board. When the SIMM is mounted it is about 3/4 inch above the spot where the ram chips were removed. I then take another strip of adhesive foam and cut it to a width of 1/4 inch. This strip is placed on the top rear of the SIMM I just mounted on the board. Now I carefully place the second SIMM directly over the first. It is important to line the two SIMMs up so that they match exactly. When completed I have the two SIMMs stuck together, with one on top of the other. From this time on, consider the top SIMM to be the "High" and the bottom SIMM to be the "Low" column.

For the STs with the ram under the keyboard, the upper bank of ram chips just happens to be the ones farthest away from the front of the machine. It also happens that the "High" column is o the left and the "Low" column is on the right. To make remembering easier I use a marker and mark the center between the two columns. That make eight on the left and eight on the right side of the mark.

If you have one of the STs with the ram under the powersupply, you will need to use the ohm meter and verify the locations of the upper and lower banks. While I have looked at one of these beasts I have not done an upgrade on this particular style so I cannot suggest a location for the SIMMs.

The following pinouts will be critical to your successful upgrade: 1 meg x 8 SIMM

```
0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 1 1 1 2 2 2 2 2 2 2 2 2 2 3
1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
| | | | | | | | | | | | | | | | | | | | | | | | | | | |
V C D A A D A A V D A A D A A D A A N D W V D N D N R N N V
C A Q 0 1 Q 2 3 S Q 4 5 Q 6 7 Q 8 9 C Q E S Q C Q C A C C C
C S 0 1 S 2 3 4 5 S 6 7 S C
```

256K DRAM Pinout

```
1> A8 16> VSS
2> Din 15> CAS
3> WE 14> Dout
4> RAS 13> A6
5> A0 12> A3
6> A2 11> A4
7> A1 10> A5
8> VCC 9> A7
```

If you notice, there is no A9 on the ram chips. This is the new address line and special consideration is required. I will cover this further on.

I start by making a check list numbered from 1 to 30 with two columns, one for the upper and one for the lower columns.

PIN 1
Beginning with pin 1 on the SIMMs take the kevlar wire and strip back about half an inch. The neat thing about the wire is that it fits perfectly into the holes on the SIMMs. Since the Vcc line is common to both SIMMs I insert the wire into the lower SIMM and solder it into place. I then attach the wire to the upper SIMM and solder it. Because the Vcc line is what it is, I now use a slightly larger gauge wire and run it from pin 1 of the SIMM to pin 8 of the nearest vacant ram. In order to keep things neat, I keep the wires as short as possible without any undue stress.

Since I removed the 16 ram chips I have my choice of spots for the placement of the wires run from the SIMMs. The following considerations should be taken into account.

The address lines A0 through A8 are common to all the chips. The CAS lines are split so CAS1 H is common to the upper column of 8 chips and CAS1 L is common to the lower 8 chips. The RAS1 line is common to all 16 chips. The DQ lines are separate and require special wiring.

PIN 2
The CAS line on pin 2 of the SIMMs needs to be split up. The lower SIMM is wired to any convenient pin 15 of the lower column. The upper SIMM is wired to pin 15 in the upper ram column.

PIN 3
DQ0 is split. The lower SIMM is run to the first chip socket of the lower column. This should be the chip closest to the spot previously marked as the center. Both columns run from left to right. The DQ label corresponds to the Din or pin 2 of the ram socket. The upper SIMM is wired to the ram socket farthest to the left.

PIN 4
A0 should be wired from the lower SIMM to the upper SIMM. It should then be wired to the nearest ram socket pin 5. The only major concern here is neatness.

The rest of the wiring follows the same order listed above. Pin 21 of the SIMM should be jumpered between the two SIMMs and then run to ram pin 3. Pin 27 of the SIMMs is also jumpered between the two SIMMs and then run to ram pin 4.

PIN 18
The A9 line is the new address line which is required when 1 meg chips are used. This line should also be jumpered between the two SIMMs. Using the Kevlar wire I run to one of the holes where the ram chips were removed. What I like to do is drop the insulated wire through the hole and run it over near the MMU. The idea here is to run the wire from the SIMMs pin 18 through a 33

ohm resistor (which you need to come up with) to pin 64 of the MMU. I like to use a little shrink tubing over the resistor connections since this is an outboard hookup. Using a couple of convenient holes for wire routing simply makes for a neater job.

I follow my check list exactly and mark each connection as it is made. Since the key to a well done job is top quality craftsmanship, I am careful to do the best job I am capable of.

There is now a final set of steps which is required to make this upgrade work. Because the upper bank of chips was removed, it is important to do something about the routing of the Row and Column address strobes. The configuration of the computer as it now lies consists of an illegal ram configuration. By this I mean that you have a 512k lower bank and a 2 meg upper bank. This needs to be reversed.

Reversing the CAS and RAS lines is simple but can be tricky. If you don't get exactly right your computer won't boot at all. It won't hurt it, it just won't work. What I like to do is locate the resistors these line pass through. The technique is to identify which resistor is associated with CAS1 H. I then identify find the resistor for CAS0 H. Once this is done I will lift one end of each resistor. Using whatever technique i can that is clean, I cross wire the ends of the two resistors to their respective holes in the pc board. I then do the same for the CAS1 L and CAS0 L lines.

Finally I identify the RAS1 and RAS0 lines. These two lines can be found side by side with the CAS resistors. On the foil side of the circuit board I cut the foil between the pads for RAS1. I then do the same for RAS0. If you look at the spot where the resistors are mounted, it looks like there is a place for two more resistors to go. This is usually where the RAS lines are found. The final step is to run jumper wires in order to cross wire the RAS0 and RAS1 lines.

It is important to check your work with an ohm meter at this point. I use a Fluke 77 which has a diode checker position. This setting of the meter is safe for CMOS circuits boards and also makes a beeping sound whenever it senses a short. The following measurements should be taken and verified.

MMU Pin # SIMM pin # New Identity

6 <==========> upper 2 CAS0 H
7 <==========> lower 2 CAS0 L
8 <==========> both 27 RAS0

You should also verify the new CAS1 H, CAS1 L, and RAS1 lines. These lines go to the remaining ram chips which are now your new upper bank.

Ram Pin # MMU #

4 <==========> 18 RAS1
15 (right) <===> 21 CAS1 L
15 (left) <====> 22 CAS1 H

This completes the upgrade. If you want to go to 4 megs all you need to do is make a few minor changes. Remove all the ram chips and of course use 2 pairs of SIMMs. Wire one pair into the upper bank position and the second pair into the lower bank position. You do not need to do anything about swapping the CAS and RAS positions.

If you are doing the upgrade on an older 520 that does not use the 1040 mother board you can also ignore the part about the CAS and RAS swapping.

I would like to suggest that you get ahold of some type of memory tester program. There is one in the GEnie library written by Barry Orlando which will do the job nicely. Another program written by Willie Brown does a good job as well. It is also possible to use NeoDesk to look at but not test our memory. With Neo Desk simply click on the desktop info and read the screen. there is a line at the bottom of the screen which identifies free memory.

I will admit that once or twice my upgrades did not work at first and required some trouble shooting. If this is the case, you will need to double check your work. Each time I had trouble it was caused either by a faulty solder connection or by getting confused when I swapped the CAS and RAS lines. If you get these lines wrong, you will probably not hurt anything, but your computer will lock up during the boot cycle. The only way to really hurt things is by wiring your VSS and VCC lines to the wrong places.

There is one other place you may get some trouble.
If you are upgrading from 512k and the computer has never had a memory upgrade before, there is a possibility that the MMU chip could be bad. This can occur because the CAS1 and RAS1 lines have never been used or tested. I ran into this problem once. It also doesn't hurt to remove and clean the MMU and its socket. This can pay off on the older machines.

Just in case I have inspired you to go out and do this upgrade, let me advise you that it takes me about 6 hours to do this job. Using a good desoldering machine to remove the old ram chips takes about 1 hour. You could also use a fine pair of cutting pliers and clip out the chips. This would be much faster, but I like to save the chips for other projects. The fastest upgrade I did was on a 520STFM where the 1040 mother board was used. There were no ram chips to remove.

Now that it is all done, it is time to sit back and enjoy your work. 2.5 megs is a pretty nice upgrade. The cost was fairly reasonable, the SIMMs cost $90 to $110 a pair and 100 feet of Kevlar wire costs about $5 bucks. The only other cost is for the resistors and depending on the computer you will need from 1 to 4 of them. I recommend using 1/8 watt 33 ohms.

I hope that this information is of some value to those of you who have read it. You may use this document in your club news letters or magazines provided it is printed in its entirety. You may not remove my byline cause I need some claim to fame. Finally if you should choose to perform this upgrade and kill your computer, you can always buy an STe and sell your dead computer to me, really cheap. Heck, I can always use a few more spare parts.

Yes, yes, yes... I know all that. I also knew the moment I hit the RETURN
key that someone would probably snipe at me for the 'emulator' comment.
Must have been in a masochistic mood yesterday.

All I know (or care) is that it allows Macintosh hardware to execute
Atari software and in my mind, that's close enough to an 'emulator' for me.

"A rose by any other name ..." and all that rot, ya know?

OK, so maybe we were discussing different things, then. My contention was
that "OK, the 040 is internally double-clocked... so what?" Doesn't matta.
The only reason Motorola and Apple have started touting this "feature" is
to compete with the advertising claims of the DX2 & DX4 Intel chips.

> So if you want a bet about _how_ it's doubble clocked, then it's fine with

>

I'd like to add my four penn'orth, too. I've not yet found the time to even try to ftp to Hensa (or elsewhere much, for that matter, - work tends to intervene) so I can't comment on the quality of what the archive contains. However, I do know that to maintain such a site must take a hell of a lot of time and effort, and Danny deserves the thanks of every Atari user on the net for his efforts. If the management of the Hensa site see fit to restrict access, so what? I think we should consider ourselves lucky that ANY of the sites on the net allow us access to their machines. They pay for them, and for the upkeep - and even if it's taxpayer's money, as a lot of uni funding in the UK is, and I am a taxpayer, I still have no call on the specific use of it.

rsh seems to have played his usual trick of putting mouth into gear before engaging brain, else he would realise the truth of what many before me have said. I don't know what Danny's day job is, and whether the maintenance of the archive is part of it, or whether it is done as a sideline; what does seem apparent is that he spends more time at that than rsh does working for the NZ Govt. Buying that PC could be the biggest favour that Roge could do the Atari community!

Please, Danny, ignore him. The Atari is already so poorly supported by the micro world at large that we need every friend we can get.

Incidentally where DO you work? you post from qmw, lancs, and others. It's very confusing!

2287. Re: Magic incompatibility list

Newsgroup: comp.sys.atari.st
Date: 1995-02-15 19:09:00 UTC
From: Jens Andreasen <jens-and@dsv.su.se>
Message-ID: <Pine.ULT.3.91.950215194021.6466A-100000@mars>
Source record: 171536

OK you guys, the issue i wether the 68040 is clockdubbled in some fashion or another or not, right???

Do this test:

compare the raw *integer division* timing to the Intel chip ! (..D0,D1)
^^^^^^^^^^^^^^^^

>>Why ??<<

Because there is no *smart* way of speeding up the division (except for catching some special cases like x/2), {unlike addition or multiply} !!

The timing of division is depended on *raw speed*.

Iff the results are fairly equal then the chips *must* be build in a fairly equal way (give or take a few gates/clocks)

Iff the result differs a lot (say that Motorola uses twice as long time) then the two chips are *not* using the same internal clock, and (as far as I can see) Kim has lost the bet....

Patiently waiting for the final outcome. / Jens Møller Andreasen

2288. Re: Falcon video fault

Source record: 171537

Whilst I can't help you with your Falcon fault, I can probably tell you why
yo get service problems. Unless they've changed with the Falcons, when
Atari sell the machine, they also sell the warranty ; this means that the
warranty is eventually held by the retailer that sold you the machine.
Therefore, if he is not prepared to offer on-site maintenance, you ain't
gonna get it.
I found this out the hard way over an 8bit many years ago, and over an ST
a few less.

BTW it seems that the markup is on the order of 801f wholesale price to
allow for the warranty as well as the profit. This may explain the
apparently ultra-low prices being discussed in another thread??

I tried to find an internal clock several years ago, and was told by
Microdeal in the UK that it was ceased because, like a similar BBC Micro
clock, it would occasionally develop a hiccup, and feed back from the NiCd
batteries into the PSU or the motherboard or somewhere and do expensive
damage.(as well as flattening the NiCds)
I currently use a cartridge one by AlfaData (Italy) with a thru-port. It
only sticks out about 1.5 inches and does not get in the way. Not ideal, but
it'll do me. You could, of course, buy a HDD with internal clock??

I have found out what the problem is. The last word of the screen discriptor
block is supposed to be zero. Touchup puts in a 1. xv checks this word
to see that the file is ok. I edited the file, replacing the 1 with a 0,
and xv was happy. I have told Migraph about the problem.

2294. Screen interfearence.....need HELP.

Newsgroup: comp.sys.atari.st
Date: 1995-02-15 21:42:34 UTC
From: joseecek@deepcove.com
Message-ID: <3htsga$o7g@Kaos.deepcove.com>
Source record: 171544

My system consist of:
Atari 1040 ST (TOS 1.00) +ExtRam board with 2meg SIMMs.
SH 204 HDrive, SC1224 colour monitor.

I'm experiencing problem of what looks like RF interference of
diagonal across the screen vertically 'running' lines ('waves').
showing up periodically every one minute. The lines are
'running' fast at first appearance and gradually decreasing speed
until they'll stop for couple of secs, and disapear in reverse
direction.

I'm realising that Marpet ExtRam board sits on top of metal casing
inside the ST. Grounding wire is connected. The lines were visible
even before the board was installed, but not as strong.

My question is: If anyone experienced this fenomenon, what is the
remedy to eliminate it?

Thank you for your atention.

josef.palecek@deepcove.com

AFAIK there is no "fixed" maximum, but signals degrade badly at much over 3 or 4
metres. if you really want the comp & printer in different rooms, you may
have to look at parallel-serial and back conversion at RS232 levels. Either
that or drill a big hole in the wall :-)

best o'luck

>
Of this list, I would highly recommend the following:

Airball: My raving about this game may be a little much by today's standards, but this game utterly blew me away when I first played it, and is still one of my favorite ST games. The thing I love about it is that I utterly got lost in it - the music, scenery, and mood are soooo absorbing! Basically, it is a 3/4 perspective 3D type game (ala Immortal or Landstalker for Sega), where you are a bubble who is trying to figure out how to return to your original human form. You cruise around a HUGE dungeon trying to collect objects and solve puzzles. There isn't much in the way of fast action, other than some golem-looking things which walk back and forth - finesse is definitely the rule here, but time is also an issue - if you don't visit an air pump thingee on occassion, you die.

Flight Sim II: Decidedly low-tech by today's standards, but very detailed, and engrossing if you get into this sort of thing. I learned lots playing this... You can also play over the modem with a WWI dogfight.

Rick Dangerous I & II: Easily the most obscenely difficult Mario Bros. type game I've ever player, but lots of fun. I can't believe I was masochistic enough to finish the first game - I never solved the second. The grax and sounds are downright hilarious, and if you're into platform type games, this one is a must-have.

Source record: 171453

Hi,

Please do not hang my head for it, I only report what I heard from a friend that I do not totally trust. But then again there is almost always some thruth in what he says. The story is this:

He worked a couple of days for IBM-the netherlands for their server-service department. (This is confirmed). At the time of his work IBM were testing a new kind of computer hanged in a network. It runs on PowerPC and has 3 slots to add a board in it. The board attached to the PowerPC determines what software it can run. Boards running in the test site were: MS-DOS, Apple system 7 and TOS. He has a lot of experience with Atari, and he is sure he saw GEM working on the it.

Please note that it is complete rumour, I just report it.

Joost.

Hi, in reply to the mail about Atari only making machines on mass order:

St Format some time ago talked about this problem. Atari said that they would continue to make STe's if they got an order for a thousand or more units. St format pointed out that no shop could afford, or even sell this number of units, so the leading atari dealers could get together and buy 1000+ units between them. Wether anyone actually did this I have no idea.

By the way did anyone see on British t.v on wen 15th Feb 'Hown do they do that'?
There was avery nice bit about Virtual reality, in the last shot the guy who owns Virtuality (Company that make all those machines you see in the trocadero) was wearing a headset rigged upto a Jaguar, with Cybermorph in? If anyone knows anything about this could they (Cybermorph being made as a virtual reality game) could they mail me.
Thanks from Ray.

2308. Re:Formating on Ms-DOS problems.

Newsgroup: comp.sys.atari.st
Date: 1995-02-16 11:09:53 UTC
From: "<Worried? You should be.>" <cs2ev@herts.ac.uk>
Message-ID: <Pine.SUN.3.91.950216110833.23905F-100000@altair.herts.ac.uk>
Source record: 171459

Hi, Ray here.
First if you used your Megga STe to format all your discs you would not need a program to do it. As far as I know ALL Ste's (inc Megga?) foramat MS-DOS from the GEM desktop. However, be careful you are not using a High Density disc with your atari, it will cause errors and reading problems. Just format discs on the Megga (using GEM desktop, no programs) and you should have no problem putting the disc in an IBM compt computer.
However, they STfm cannot format MS-DOS, and I'm not sure it can read, without software help, so you may need a program if you want to use the discs on your FM.
Hope this was of some help.

From Ray,
email: r.c.smith@herts.ac.uk

On Thu, 9 Feb 1995, Doug Finch wrote:

Source record: 171460

: I would like to point out once and for all.

: ATARI IS NOT OUT OF COMPUTER BUSINESS AT THIS TIME!!

This is true according to both Atari UK and Sam Tramiel, Atari still makes
computers.

: So I guess you're right :-)

: They are still producing Falcon's, we can get new machines instantly here in Europe.
: Atari do NOT have any further plans on cutting the production.

The production probably is low enough that Atari can sell it without any
huge difficulty. Why should they stop making computers when it still makes
a small amount of cash for them? That would be reverse business sense.

No need. The ST monitor port has a composite out (pin 2 I think).
I made a lead a couple pf weeks ago, but to be honest, the signal
quality seemed below par (compared to a Sony TR1E Handycam). Nothing
beats RGB !!

Check your manual for the pinouts. If you don't have it I'll check
mine tonight anyway. Ok ?

Cheers

I _think_ it's about 3 metres, 'cos the ST uses the YM2149 to drive the parallel port and it's way underpowered. If you want to site them _really_ far apart you'll need line drivers.

2313. STacy4 For-Sale

Newsgroup: comp.sys.atari.st
Date: 1995-02-16 12:32:02 UTC
From: ap748@cleveland.Freenet.Edu
Message-ID: <3hvgk2$c9g@usenet.INS.CWRU.Edu>
Source record: 171464

Hello,

I've decided to sell my STacy 4 because I just don't use it enough.

Atari Portible STacy 4
4 MEG RAM
52 MEG SCSI internal hard drive
720 3 1/2" floppy
External Power Supply
Corduroy/nylon carrying case with handle and shoulder strap
Has standard ST ports. MIDI, Paralell, Serial, Mouse, Joystick, DMA, Monitor
Has built in track ball, but if you wish you can use a mouse
Has built in backlit LCD 640x400 mono screen.
You can hook up either an external color or mono monitor.

Unit is in great condition and works fine. Asking $800 or best offer.

E-mail me or call 216-729-0761 evenings 6:00 - 10:00 PM EST

I think you have to run HSMODEM *after* Mint, ie ignore what the
HSMODEM docs say. The MintNet docs may be of some help to you.

>the ST? Is there anything newer than 3.0? If so, were can I get it?

v3.5. If I remember correctly, it was in the ftp.uni-kl.de.
I think it's twice as fast as the old 3.0 (better compiler :),
although multitasking under GEM (if I use the gpclient) on my
1.4 TOS eats away most of that speedup...

The ported GP has a term named 'mtos' which works under MiNT and
MultiTOS. Plotting with that term will spawn a program named
gpclient (communication with named pipes) which uses a bit large
dynamical GUI library named Magic (library name and configuration
is behind one cookie structure which has to be installed with a
separate program). The client is good, but I don't like the idea
that GP itself starts it as then I can't use the programs on
different terminals :-(.

It`s short for Grid Array Logic and is basically a small IC which
can be programmed, like an EPROM I believe, to perform different
logical operations and actions on incoming signals. Unfortunately
I don`t know _why_ a GAL is needed in the MSTE.

ICD allows partition sizes of 512 megs. A drive larger than that would be partitioned. I have ICD's Pro softwarw with 2.5 gigs online.

The actual length depends upon the particular printer/chip in the ST, Deskjets
for instance are particularly dodgy. In ST Applications there was an article
on buffering the strobe line to improve the length that the cable could go.
(This apparently is the most important line as it keeps things in order).
This also means that you don't need some program to "reset" the parallel port
if you turn the Deskjet on after your ST. You can buffer all the lines but
that might be overkill. I'll try to dig out the article if you like but it
might take a week or so (it's at home).

>the bet from the beginning. If you did not think so, please let us know
>what you thought.

My statement has been from that start, that the 68040 is doubble
clocked, and nothing else.
I don't believe you'll find any messages from me saying anything about
how it's doubble clocked, as i would have no idea on this matter, and
therefore would be stupid of me betting on this.
So the question is really simple:
Is the 68040 internally doubble clocked ? Yes or No.
Thats really all.
If the answer is No, then Hendrik win.
If the answer is Yes, then i win.

>
>You might (not?) want to know that Hendrik and Hutch _are_ right here as
>has been said in comp.sys.m68k a couple of times.

I sure want to know who is right here, no matter if i lose or win.

The issue here is not really the bet, (at least not for me), i'm just after
information as usual. And if it takes a bet to get the real info, then i
just have to pay whatever bourbon Hendrik wanted.

>Hendrik has already explained that in a previous post.

He probably did, but either i've missed it, or then i may have misunderstood
the message.
If you are refering to his last message were i think he said something about
a part of the 040 is working different from the Intel, and therefore isn't
giving the same result, then i can only say this message told me we're betting
on two different things.
I believe he things i'm betting on the 040 is doubble clocked the same way
as the Intel, and this is were he has misunderstood me.

Why would anyone want to buy an Atari? I do believe that they are
the best MIDI platform (yes, even better than MAC, DOS, or Windows machines).
I have one running my studio and have produced two albums of original music.

But is there any other reason that one would want to put up with
such a small company?

For some reason, Atari is popular in Europe. Maybe someone could
give some reasons for that. (Even if you don't need a reason.)

Ahmm!, perhaps my english isn't the best, but who said anything about a
Mac emulator ? Infact i wrote on the subject line, that i didn't want to
hear a word about MacMagic. And since i'm asking for Magic for the Falcon
what gave you the idea that i was talking about a Mac emulator ?

To try avoid more mistakes, i might open up and say, i'm asking about the
'so called' new OS for the Atari computers which is suppose to be named
something like Magic, (perhaps Magic 3.0, i wouldn't know since i havn't
seen it yet).

The stuff was taken from the comp.sys.68k-faq.

>>IMHO, APEX is not for proffessional use, as it does not provide Anit-Aliasing.
> Check again. It does anti-alias, and very quickly too.

If it really does, I apologise. But I can hardly imagine a Falcon doing a
picture in broadcast resolution (768 x 576, 24 bit), with AA, in a reasonable
time. Not to mention a whole 2D-animation.

> So what? You can't record/playback 16 tracks D2D with a Soundblaster 32s
>either. Furthermore, what does that have to do with processing power?

RE: Comms programs with scripting capability

STORM, the followup to Flash from the original author of Flash, uses a virtual clone of 8bit Atari BASIC as its scripting language, which allows a very good range of flexibility in programming.

BASIC was chosen as the script language because most people are already somewhat familiar with it, which makes it easier to use than some obscure proprietary scripting code.

The program came with several examples of what could be done, but unfortunately not many people ever did much with it.

STORM is shareware, and should be available on Atari ftp sites.

Flash and the sequel Flash II use a more limited (although still adequete) scripting language for their "DO" files. Both Flash and Flash II are commercial programs.

CW> Unquote.
CW> Perhaps in their infinite commercial wisdom Atari did not wire this line
CW> in the SF354 cable???

The cable is fine, but the internal electronics in the SF354 do not carry the side select line to the drive mechanism. Best bet is to remove all active components from the little PC board in the 354 and bypass the original ribbon cable connections - go straight to the DIN connector with the new ribbon cable. I've done this successfully a half-dozen times.

Source record: 171490

Mike Wasinger (mwasinge@nyx.cs.du.edu) posted:

: (1) What signals are on the 19 pin line?
: ASCI ? (What is ASCI and how is it different than SCSI?)
:
: (2) What is the 50 pin cable?

SCSI cable.

: (3) What does that small board do, and what is it called?

It's an MFM to SCSI adaptor, but a cut down one; you can't just plug any
SCSI drive into it; it's pretty tempremental.

: (4) What is the large board over the drive? Does it convert
: SCSI to MFM or what? What is the board called? It has
: an extra ribbon cable header. Is this used to hook up
: another drive as I have heard is possible with the
: SH204?

Yes, it's an MFM to SCSI converter (Adaptec A4000).

However, (and I'd like to know too ;-), I don't know how to add multiple
drives to the board.

: (5) How could I hook up an unused SCSI drive (from an old
: Mac) into this system? At what point does it get attached?
:
: (6) I read in an article about MacMagic that this new Mac based
: ST emulator could read/write to Atari HD's hooked up to the
: Mac's SCSI port. Does this mean that the 19pin port on the
: back of the SH204 is true SCSI?
I think you'll find that's Atari formatted HDs, Falcons and TTs run
directly to SCSI, they don't deal with ACSI.

: (7) Will only MFM drives work attached to the large board?
: What drive mechanisms will work with the SH204 controller
: board? Where can I find the format parameters for use in
: Atari's format program datafile WINCAP?

Erm, it's an MFM to SCSI converter so it's not much use as anything else :-).
Dunno about the second bit. Have a look at comp.sys.pc.hardware faqs, I
believe they carry most of the stats for HD's (even old ones).
Or ICD's pro utilities carry an enormous amount of drive stats.

: (8) What are the recommended means of speeding up HD I/O given
: that I am using TOS 1.0 in ROM. What PD programs are helpful.
: How much is TOS 1.4, and where can I find it?

Tos 1.4 is fairly cheap now, you should upgrade really...
I think it's about 25ukp, which is about 35-40 dollars isn't it?

Regards,

Paul.

Is there anyone out there developing a Web browser for Atari computers?
I just spoke with George Geczy, the author of Hyperlink for Atari
computers. It is a Hypertext development system which supports Dbase
files, IMG, text fields, buttons, icons, etc... It is not specifically
for HTML, although, it is conceivable that it could be re-written or
patched to serve this purpose. Aside from the translation, it would also
have to be taught to telecommunicate.
In any case, much of the work has already been done, and the
Author is willing to sell the code (cheap) if there is another developer
interested in continuing his work, and/or adapting Hyperlink for HTML.
He can be reached at

AFAIK the Atari user base is even more friendly than it used to be. Many
Atari owners help the userbase out of love for the machine because there
isn't really much hope of making good money out of it any more.

> net access. Is there any chance of civility and help myself if I

2355. Where to find a RAM-Disk?

Newsgroup: comp.sys.atari.st
Date: 1995-02-17 00:54:46 UTC
From: jscholar@ccnet.com
Message-ID: <3i0s4m$l2v@ccnet3.ccnet.com>
Source record: 171402

A friend of mine desparately needs a RAM-Disk program so that he can transfer thousands of files onto an IBM-conpatable disk without popping the disk in and out of the drive thousands of times (Disk-copy unfortunately copies the disk format along with the disk).

Does anyone know the name of such a program or of an FTP site that would have one? "atari.archive.umich.edu" is off-line at the moment.

Thanks,
Joshua Scholar (jscholar@ccnet.com)

2356. WANTED: 40MB OR BETTER HARD DRIVE

Newsgroup: comp.sys.atari.st

Forget the last message.....
I now have HSMODA06.....
So I have a Falcon; I have DRVIN.PRG in the auto folder. What other driver so I need? After reading about the others, it soulds like none of them are for the Falcon!

There must be somebody who has got HSMODEM working on a Falcon...Hmmm?

Please, please help...I need a faster connection.

2360. Re: ST Games decline... Producer's Fault?"

Newsgroup: comp.sys.atari.st
Date: 1995-02-17 08:13:53 UTC
From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D44xJ5.2Hr@news.hawaii.edu>
Source record: 171409

Why has Atari been left behind in the entertainment scene?

I can see several reasons that the Atari entertainment market has dwindled so significantly. To begin with, Atarians have been the piracy scapegoats since the 8-bit days. Lots of companies wouldn't do Atari games simply because of the bogus reputation. This also led to a horrific scourge on the Atari community, on disk copy protection. Although this can help prevent piracy, it also renders many games incompatible with a large number of the systems in circulation. Most protected games will not run on anything but a stock ST - largely because the copy protection methods were so severe. When I got a Mega STE, I found that most games wouldn't even begin to boot because of bad sectors at the beginning of the disk. Frequently, I have heard of hacked versions (with protection removed) that would run perfectly. And even on a Turbo25 ST with TOS 1.0 or 1.4, most protection schemes render the games unbootable.
The disk protection also has the added effect of refusing to run on some machines (simply because not every disk drive is identically aligned or speed calibrated, and many protection techniques are VERY picky abouth this. Several of my games including Epic, Dragons Lair, Stunt Car Racer, etc... would only run on about 30% of the machines that I have access to.
In addition, some protection methods even use physical damage to the disk (in the form of laser burns in the MIDIMOUSE music lessons series). As one might guess, this can render the disk impossible to backup, and at the same time, more likely to fail.
And who can forget that most protected games will also not run from a hard disk drive (which gets maddening with games like Robocop 3 - an excellent game - but one that requires feverish disk swapping).
Another element that kept me from buying many games is that features that wer undoubtable dificult to implement on other platforms, like MIDI music on PCs, were ommitted in the Atari versions. When Loom and Ultima VI came out, I refused to buy them for this reason (why not have MIDI support for ALL Atari games? All Atari's have them... I don't know too many people that have MIDI on their Macs, PCs, or Amigas).
Also, features like cyberlinking/networking were also frequently left out of the ST versions, which is silly, since several earlier games such as Falcon, Stunt Car/Track Racer, and Midi-Maze showed that this was not only possible with the ST, but a hell of a lot of fun!
Late releases such as Dogfight from Microprose had little purpose without the ability to dogfight with another human being.
The entertainment industry also ignored that the ST can be pushed to get better results. Photochrome and Spectrum 512 (and Anispec) showed that the ST can display graphics and animation at 512-19,000 colors. Any

stock ST can pull off 512 color animation - try that with a 1985 PC!

I'm actually surprised that anyone bought ST games at all with
all of this working against us. I know that I have been frustrated again
and again to the extent that I sold almost all of my games (and bought a
Jaguar ;-) It's just sad that the software companies didn't realize that
they weren't just depriving us of enjoyable software, but they were also
kissing profits goodbye. Now they would say that the Atari computers
aren't profitable enough to develop for - but they never seem to want to
take credit for having made it that way.

Unfortunatly, it's not just games. Heck, I'm still steamed that I
have shelled out over $1000.00 for my C-Lab Notator/Emagic Logic Midi
sequencing software, and it only boots about 50% of the time because of
the cartridge dongle (hey folks, I've had two dongles, and three different
computers - it's not me, its the copy protection).
I'm certainly not happy about it, but I can't really blame people
for changing platforms. Software publishers have made it unbearable to
use software for these truly wonderful machines.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello everyone!

Just a quickie for y'all to muse over....

Does anyone know what the "General Purpose Output" is from the monitor port on an ST? I ask this because I have an RGB monitor available to me which has RGB connections, that's no problem, but also needs composite sync. Would this General Purpose Output, by any chance, be this elusive composite sync??? If it isn't, I'm still interested in what it is. (Atari couldn't have really given a more vague description, now could they!)

I can get an I.C. from Maplins that will extract composite sync from the composite video output, but it costs about 5 quid, and 'cause I'm a tight git, I'm trying other ways first!

Cheers for any help!

ROB.

There is a composite synchro signal on the monitor connector (pin 2).
The GPO pin is connected on bit 6 of port A of the PSG (I think it could be
used as an input despite its name - General Purpose Output).

|> Hope this was of some help.
|>

I believe that the fm was originally designed to both be 100% compatible
with MS-DOS disks. It is able to read and write to MS-DOS disks, but is
not able to format disks to MS-DOS standard (using TOS routines). All that
was wrong was 2 bytes in the bootsector. There are many other formatters
(such as Diamond format) that simply correct these 2 bytes.

On STE's and latter machines, this bug in the OS was corrected, and so,
the Desktop / Newdesk formats MS-DOS disks.

Hope this clarifies the MS-DOS format problems....

How come quotes for prices of Atari-compatible CD-ROM drives are so high?
I get quoted about 200UKP (e.g. the 'Apple 300e') for these when I have seen
CD-ROM drives advertised in Computer Shopper and other PC mags for only
about 100UKP. I have an Atari Falcon, so I surely should be able to connect
just about any CD-ROM drive to it. I just want a drive to read samples off
sample CDs and perhaps play back CDs (perhaps through the Falcon DACs with
bass-boost removed)- I don't want to do graphics work or anything particularly
random-access-intensive with it. For my purposes would I be better off
getting an audio-orientated CD player instead?

Any information/comments would be greatly appreciated.

Yes, I'll agre on that if the benchmark is written in say C. But you could roll your own just to settle this ongoing argument and implement it in assembly. You don't even have to run the test, just sum up the timing of the op-code it takes to do "something sensible" (whatever you decide that to be.)

2378. First word plus

Newsgroup: comp.sys.atari.st
Date: 1995-02-17 14:27:11 UTC
From: rg185@csc.albany.edu
Message-ID: <3i2bnv$n2e@rebecca.albany.edu>
Source record: 171422

I have a 1040st and several hundred documents that were created with first word plus. I would like to transfer them over to the DOS world without having to perform alot of modifications. I tried saving them as ascii files and then downloading them over but all spaces including hard spaces disappeared and each line created by FWP became one long word. Someone has told me that if I get Word perfect for the Atari and read them in then I can "easily" use them in WP for DOS. Is this true and if so where can I obtain WP for the Atari ?

Anthony Jacques (jacquesa@cs.man.ac.uk) wrote:
: On STE's and latter machines, this bug in the OS was corrected, and so,
: the Desktop / Newdesk formats MS-DOS disks.

Not quite! My STe with TOS 1.62 formats disks that MS-DOS recognises
but it does not mark the non-existent clusters 0 and 1 as in use in
the FATs the way the MS-DOS formatter does. I never risk writing from
a PC (or anything else claiming to write MS-DOS discs) onto a disk
formatted by the STe, just in case they go by the FAT and I end up
with a corrupt root directory and other nasties.

Another bug is that the ST interprets the number of clusters
incorrectly - it will never use the last two clusters, but seems happy
to read them if the PC has filled up the disk. If you 'fix' this by
altering the number of clusters, a PC will try to write to
non-existent clusters off the end of the disk!

Another difference is that the STe allocates too many sectors for the
FATs. This is harmless, it just wastes a bit of space.

Hi.
Is there any program that adds features to the GEM desktop, that requires memory only for those features requested.

ex. if I want double click on right mouse button, but not the new icons for printer, the extra gem menu... The only thing loaded in memory should be the 'clickthing'.

>Ellis Breen

Ellis,

not exactly sure if there is such a thing as an audio-orientated CD
Player and a "graphics"-orientated CD, although I do know that there are
some that have graphics capability but no sound.

Anyways, all you actually require is a CDROM that can be attached
via SCSI, many PC CDROMS attach via the ide port so I'm not sure that those
will work on your falcons as they also require very specific drivers (such
as the Puma syquest drivers do..). Just make sure I guess that you have
audio capabilities _and_ can read ISO9660 standard CD's (and perhaps Kodak
Photo CD as well).

I ca't quote you UK prices, but a 1xspeed will go for 99 U$D or
less, the 3xspeed Toshiba costs 199 U$D in the U.S. These are fairly
reasonable prices IMHO.

Cheers

:> > Mac) into this system? At what point does it get attached?
:> Attach it to the host adapter. You will no longer need the Adaptec
:> anymore.

But it doesn't always work. For example, we tried to use a Quantum LPS52S
with a SH204 hostadapter, and it didn't work OK... sometimes it began to
throw errors, which could only be cured by switching all off 1/2 hour.
With an ALIA, the drive works OK, and so does the original MFM.

But here in the Informatik, there are some SH104, where the MFM disks have
died some years ago. They were replaced by Quantum drives, and work OK.

But I should tell you that Helge Schulz might have had his fingers in there...

You need that extra life to create all the boot discs with different CONFIG.SYS and AUTOEXEC.BAT files so that your children have some chance of being able to play the PC games!

As has been said here before, many of us have both, and judge for ourselves based on our own experiences. My personal experience is that if you want to do some C programming for fun, especially if you are looking for a free compiler, forget the PC, use the Atari.

> > Do they still exist? Do they still
> > make or sell computers?

They make a few and sell a few. Most of the Atari computer marketplace is in used or third party hardware and software.

> >Should I bother upgrading, or should I bail?

Unless there's some Atari-specific application you want to run, there's no practical reason to upgrade (unless you've got Atari religion). The most practical upgrade path is to find a newer, faster, bigger Atari than what you've got. Adding pieces to an old ST is probably not worth doing.

As for bailing...there's not much bailing to do. Ataris have little resale value, but most of them are still usable, supportable machines.

> There are coming a lot of interesting software/hardware for the Falcon these days.

2395. Graphic WWW browser for Atari?

Newsgroup: comp.sys.atari.st
Date: 1995-02-17 18:28:32 UTC
From: hallvart@oslonett.no
Message-ID: <3i2psg$4ee@hasle.oslonett.no>
Source record: 171435

Is there a *graphic* web browser available for the Atari St computers
available? Something like Mosaic for Mac/Pc/Unix...

I have tried out a program for a PC which fools the UNIX host to think it's
a SLIP account that's being used. It's called "Winsocket" or something,
and there's TIA (The Internet Adaptor) available as well.
We have TIA installed on the UNIX system I'm connected to (modem connection)
so, can I use this with my STE? How?

From: pd@mole.bio.cam.ac.uk
Message-ID: <3i2r88$asi@lyra.csx.cam.ac.uk>
Source record: 171436

I have a spectrum emulator for my falcon called specfalc.zip. This works really well for the games that come with it.
I also found a spectrum emulator called xzx which I use on the unix machines at work (after hours of course :)).

My question is, can I use the games from xzx, which are called *.z80 or *.sna with this specfalc emulator or any other one on my Falcon?

I can't wait to play Rebelstar again!!

Thanks very much,
Phil

> --Lunatic

In the faint hope that this is actually a real request ;-) first problem is:
how much money have you got?
IMHO, order of importance should be:
more memory
second floppy
hard drive (large as possible)
TOS 2.06
monitor (rather than TV)
NeoDesk
Geneva (or MagiC)
umpteen software improvements (file selector, etc)
Falcon
Falcon with more memory
Falcon with bigger HDD

Bankruptcy??

OTOH, if it's not, BOG OFF and waste someone else's time

Dunno about the rest, but I bought mine because:
I had an Atari 800XL and wanted better
It could outperform a Mac at a fraction of the price
The PC was so ludicrously anachronistic (I can't even remember if it aws
even released)
It was easy to use
It had a good and widespread userbase
There was already plenty of software, free and commercial, available
It had MIDI, just in case I ever learned to play music

As for Europe loving it, I think all the above applies, and probably more.

Why did you buy it?

bazza

Duet is a networking package that will allow you to hook up to ataris and
exchange information via midi/lan or serial ports (Falcon lan not working
straight yet).

I however couldn't get it to work yet with two TT's...

Cheers

>Can you just pull the 68000 out and pop a 68030 in the ST?

No.. the Operating System doesn't support the chip.

There are a small number of commercial upgrade boards which give you a
68030 CPU, but along with external cache memory and timing control, these
boards also include a different set of OS chips.

BobR

2405. 68000 to 680XX upgrade easy?

From: zap@eskimo.com
Message-ID: <D45y95.5yp@eskimo.com>
Source record: 171445

If I were to aquire a 68010 through 68040 chip could I simply pull my
old 68000 chip out and plug in the new chip? Is there other modifications
neccessary for this type of upgrade? Is it practicle? Other than the obvious
expense of the new chip is it a cheap way to go? I have both a 1040 ST and a
4 meg STe with Tos 1.04 and 1.06 respectively. Any info appreciated. I do
plan on doubling the clock speed to 16MHz soon on one or the other units.

Message-ID: <3i34ii$64o$8@mhadf.production.compuserve.com>
Source record: 171447

The big difference in price range for PC CD-ROM drives is due to the style of interface used.

The very cheap drives you see advertised connect to an IDE controller, or direct to a proprietary controller (sometimes built into a sound card).

The more expensive ones, and the ones you'd need to use on the Falcon, are SCSI interface based drives.

All computer CD-ROM drives can play audio.. there really ISN'T any kind of "audio oriented" drive that will do audio but not graphics...

FLOP_FIX.LZH (5404 bytes) will probably cure the bug. I recall I
took it from ftp.cnam.fr of src.doc.ic.ac.uk /uni-kl mirror.
If you can't find it let me know, and I'll UUE it to you.

Here's the READ_ME file form the package:

This program fixes some very bad bugs in the floppy routines of
TOS2.06, 3.06, 4.00, 4.01, 4.02, 4.04. I can not understand how
it is possible to insert so much bugs in only some kByte of code -
by only adding some lines in the language C. I think it was a
very bad programmer (or a typist, not a programmer). I can not
understand that Atari does not distribute this patch as an offical
one. I tried it more than once (my first bug report I think
has gone directly in the trash can, otherwise these bugs would not
be present in the Falcon TOS).

These bugs will bite you very hard if you use above TOS versions
and have two disc drives. But one disc drive is enough to get in
touch with these bugs too.

etc...

I know this isn`t the answer you are looking for, but:

GNU emacs on a virtual console is _very_ fast!

If you like GEM-applications you could try Everest. Probably
available from most Atari FTP-sites. :-)

: >
: >Chung Yong,
: >National University of Singapore
:
: If you have a 1040STf or a Mega ST2 like I do, you will need a VideoKey
: made by Practical Solutions in order to connect the ST to a Composite
: Monitor. The bad news is that Practical Solutions is long dead. Perhaps
: TOAD might have one VideoKey collecting dust on some long lost shelf at
: the back of the store.

Well you can get yourself an old (Or new, but they're a bit costly) modulator
from an Amiga. These can be used with all ST's if you make a suitable cable.
A TV-repair shop can make up this cable if you supply them with the pin-layout
of both the ST's videoport and the Amiga modulator.

As Amigas are very delicate and tender machines (The crack up all the time.)
getting a cheap second-hand modulator won't cost you much.

: Desktop. I have TOS 4.02, I got a friend with TOS 4.01 to test this and
: the same happened for him. Copying files is fine, either single or
: multiple, but copying a FOLDER (either empty or with files inside) just
: made the machine crash.

On my TOS 4.04 this only happens when trying to copy folders to an empty HD-disk from the desktop. No problems when running MiNT, alternative desktops etc. Note that wether it's a PC-disk or not doesn't matter, the bug's still there.

:
: There's got to be a patch program for this rather odd little problem and
: don't say format the disk with the GEM desktop because I have to copy
: hundreds of disks and therefore buy them ready formatted. Thanks..

I asked for this a week ago, and the only suggestion I got was flopfix. This does not work though. Since you're having problems even when running other programs (Kobold is usually a very stable program.) I suggest you upgrade your TOS (Compo can do this I think.), the problem will then only appear in the desktop! Or use MiNT, even if it's a bit (Hey a *lot*!) slow.

I'm looking for a good text-editor too. Normally I use q.e.d. which is
very good, but not very good when running under MiNT. It grabs the whole
screen with background and all, not very practical when running multiple
programs.

Everest looks good, but it's very particular about the keyboard! Whatever
I do, I can't get the norwegian special characters on the screen, it just
prints blank spaces. Very annoying, and totally unnecessary.

Does anybody know of a fast editor which...

a) Let me use special characters.
b) Don't f**k with the background under MiNT/MultiTOS.
c) Is GDOS/Speedo-compatible.

>
>Sorry for interrupting, but doesn't transfers get better when HSModem
>is installed?
>

It sure does, and even better than Connect as well.

It seems like there is a fault in Connect. I tested a 28k8 modem a few weeks
ago with Connect running 115.000 baud on the serial port of my Falcon. I
transfered a ascii (non compressed) file to a friend of mine, which also
ran 28k8 and 115.000 baud on the port. I could only reach about 4500 cps
when running without Hsmodem.
After i installed Hsmodem i reached about 11300 cps.

Greets
Kim

Yes - this isn't too hard. But I've not seen it done with the LAN port,
at least not without additional hardware.

For networking 2 Ataris together the midi ports are quite good.

Because Atari drives tend to be SCSI based - and SCSI stuff is always more expensive (and generally better too).

> when I have seen CD-ROM drives advertised in Computer Shopper and
> other PC mags for only about 100UKP. I have an Atari Falcon, so I
> surely should be able to connect just about any CD-ROM drive to it.

What make you think you should be able to connnet just about any CD-ROM to the Atari Falcon?

Essentially the Falcon has one suitable interface (SCSI2) so you are limited to SCSI drives. The cheap PC CD-ROMs all require some sort of interface card which doesn't fit the Atari anyway. The CD-ROM-ROM interface is an attempt to get around this - but its still added cost over and above what PC owners have to pay. The other option are proper IDE CD-ROMs, but I don't know if anybody has done a Falcon driver for them yet.

> random-access-intensive with it. For my purposes would I be better
> off getting an audio-orientated CD player instead?

A CD-ROM is better - as in the long run you can do so much more with it.

Hello All,
I'm using Flash 1.6 in the Ansi mode on a 1 mb STE. When I use
the Lynx www browser all the "hot" spots come up in inverse video
(dark). Nothing changes on them when you move the cursor to any one of
them so you can't tell what you are selecting. This makes Lynx almost
impossible to use. Does anyone know of a solution to this problem? It
is the same on mono and color screens.
Thanks in advance.

No. (speaking for myself that is). I got a glimpse of a very low-res
looking moon landscape or something (?!?) and then it bombed. Not worth
the hassle i guess - phil.

Don`t regret anything, nobody is flaming you. I`m sorry if you took my last article as a flame, it wasn`t intended to be one (neither is this one)!

> To start with, I know it is possible to rename and d/l using other systems,
> but why let that in the way of a good argument?

Because, as most things in this world the computer industry is also moving forward. By being overly conservative, as I think sticking to the 8+3-filenames is, we will just dig a deeper and deeper hole for ourselves. Personally I think the hole is more than deep enough as it is. Don`t you?

> Secondly, I said "exotic" not expensive. I know all the various options
> that I mentioned are free; what makes them exotic is that minix, mint, et al
> require that I effectively replace my complete OS and learn a new language
> before I do anything else.

This is wrong, IMHO. Dropping MiNT in the AUTO-folder and the MinixFS-driver (MINIX.XFS) in C:\MINT or C:\MULTITOS is easy. Rebooting is also easy. Doubble-clicking on MINIT.TTP and typing "-V -n 2 -P X:" in the dialog is also easy (exchange X for the partition you wish to install a MinixFileSystem on). Answer y, as in Yes, to the question minit asks you if you have entered the correct drive-letter. Wait while the partition is turned into a MinixFS-partition and reboot. Now you have exactly the same OS enhanched with preemptive multitasking and a partition that you can have files with strange and long filenames on.

I wouldn`t call this difficult! And you definately doesn`t have to learn a new language. If you want more than long filenames you will also have to learn some basics about networking and Unix. This is however not as complicated as it sounds!

> Judging by the many problems posted here by
> various users, it ain't easy. And if anyone can tell me how to set up a
> partition that CAN handle long filenames without doing that, I'd be pleased
> to hear how.

Read above! The most frequent problem users have nowadays with the basic setup (as described above) is that the documentation that comes with MinixFS states that the MinixFS-driver should be placed in the root of the boot-drive. This is unfortunately not true for the latest

version of MiNT.

> It's bad enought having to convert from the GEM GUI (which is one of the
> reasons I got an ST in the first place) to a cli/keyboard screen operation
> to get into the net.

It`s the same with all computers and OSes. The "mouse-surfers" you
see on other platforms can only perform the most basic tasks with the
mouse. As soon as they need to do anything complex they too are forced
to use the keyboard.

> Just because "them upstairs" decided that the ST is a
> poor machine and anything big blue makes MUST be good doesn't mean that I
> have to agree. You lot obviously don't else you wouldn't be here.

Of course, but I still can`t understand what kind of program you are
looking for. If Mosaic or Netscape is what you are looking for then
I can understand that you are disappointed. The Atari user-base is
just too small to interest anyone in putting huge amounts of time and
money into porting such programs to GEM. The only thing we can hope
for is that some kind soul with lots of free time and a burning
interest in surfing writes/ports a graphical WEB-browser. Rumour has
it that there actually are two groups of people separately working
on two different graphical WEB-browsers. Only time will tell if
they succeed...

As someone else wrote in this group not long ago: "we kicked the
babysitter out several years ago". If you are looking for a simple path
to a "real" Internet-connection (like SLIP/PPP with a mailbox) you`d be
better of looking somewhere else, unfortunately.

If you have a 68030-Atari, a CDROM and don`t mind waiting a month or
two I`m sure there will be a CD with a complete Linux68k-distribution,
including Mosaic for X11R6. :-)

> It's obvious from the addresses that many of you out there are computer
> specialists at universities and commercial organisations. Unix is probably
> as familiar as English to you; to me it's Swahili.

But if you don`t learn Unix, or at least the most basic Unix-stuff,
you will have trouble using the net whatever platform you are running.
I`ll admit that with programs like Mosaic you`ll be able to download,
upload, surf the WWW, read/write mail and participate in discussions
like this one without having to learn any Unix. However, even if
there were programs like Mosaic for the Atari you would need to use
the keyboard every now and then.

> I had hoped, in starting
> the argument, to stimulate a few intelligent replies (I got some) not a
> flame war.

Don`t worry, this isn`t a flamewar. :-)

> All I ask is that a few of you who are considerably more expert
> than many of us, remember that not everyone is as bright or as knowledgeable
> as you. I am, I suppose, a "newbie" in net terms, and it's probably my own
> fault for not making that clear.

Unfortunately the small user-base has made the Atari a much less user-friendly computer than it used to be, at least when it comes to advanced topics such as networking. As a "newbie" it`s not easy to find info on how to get things up and running. Personally I don`t see how this could change in the future. The userbase is quickly shrinking, and the users that only play games and use their Ataris as terminals or word-processors will probably never bother to install MiNT or Linux68k and try to figure out "what all the fuzz is about". OTOH, the powerusers will continue to develop their MiNT/Unix/Network-knowledge to get more and more out of their machines. The cleft between newbies and powerusers will get bigger and bigger, and the hurdles a newbie has to pass to become a poweruser will get higher and higher as the programs that the powerusers use gets more and more complicated.

IMO, the main reason why this is happening is that there are no new Atari-users anymore. Nobody buys an Atari nowadays without knowing _exactly_ what they want. Most newbies seems content with staying newbies. The few ones that don`t likes being newbies will run into a high brickwall quite soon effectively forcing them to stay newbies even though they aim much higher. If Atari-computers were sold to new users there would be a much higher pressure to write FAQs and making user-friendly programs. Unfortunately the Ataris that are sold today are only sold to people that already have an Atari or for use as MIDI-studios (and those MIDI-packages are quite userfriendly). :-(

> However, in the past I have always found
> the Atari userbase to be both friendly and helpful to the less knowledgeable
> - or is it academic life that changes one? I never got that far, so I can't
> tell.

The userbase is still rather helpful, but as I wrote above the hurdles a newbie has to pass is getting higher and higher. The knowledge among powerusers are getting bigger and bigger, and the questions from newbies seems more and more stupid or trivial. This is at least how I feel. I`m no expert, but I believe I know quite much about Atari-computers. For every day I learn something new and get better at something else. It`s not that I don`t want to share what I know, it`s just that the newbie-questions are getting more and more boring to answer.

What we really should have is a good set of FAQs. They would help newbies to get a decent system running without having to ask "stupid" questions all the time. As soon as you`ve got a decent system running it`s _much_ easier to find answers to the new questions that might arise.

> I've tried to help others in various areas where I can since getting net
> access. Is there any chance of civility and help myself if I ask questions

> on other matters in relevant threads, or will I just get flamed again?

You keep complaining about getting flamed even though the only thing
you`ve received so far is constructive criticism. :-)

> rsh must either have a very thick skin or be very dumb to still keep posting
> the way he does and take all the flak that comes his way.

Roger is Roger is Roger is ...

He`s a grown man and can take what is coming for him. Most of the time
it`s his own "fault" that he gets flamed. His articles often reflect
an "I`m Roger, therefore my facts and thoughts are correct"-attitude.
This is often what triggers the flames towards him, and I`m sure he`s
capable of handling them all. Right Roger? ;-)

> I was raised differently.

Considering that there`s only about 3 million (right?) people in NZ I
would be _very_ surprised if you weren`t. :-)

In a message dated 2-16-95, S.Lai said:

"No need. The ST monitor port has a composite out
(pin 2 I think)."

True of ST's that came equipped with an RF modulator, but on those that do not (such as the original [non "e"] Mega), you will only find composite sync on that pin.

I can verify from personal experience that if he has a 1040STf, as he mentioned (that is, he did not leave off the "m"), that he will be out of luck getting composite video out of it on pin 2.

In a message dated 2-15-95, Robert Goos said:

"What is the difference between the various ST models I
see mentioned here (ST, MegaST, STe, TT, Falcon)? Are
all of these models compatible with the same software?"

With some exceptions for the TT and Falcon, the answer to the
software question is pretty much "YES", especially regarding
the ST and Mega ST.

The Mega ST was essentially a two-part ST (i.e. separate keyboard).
Except for an simple expansion bus, it adding nothing you might
not find in a regular ST. Of course, at the time the Mega ST was
introduced, it was the model sold by Atari that one could obtain
with 2 or 4 megs of memory installed. However, a 1040 or 520 with
aftermarket memory expansions installed was still compatible. The
Mega ST shipped mostly with TOS 1.2, whereas some early ST's shipped
with TOS 1.0. However, you will also find TOS 1.2 and 1.4 in
standard ST's, as they came from Atari, and the incompatibilites
between these versions as regards programs is virtually non-existent.

With the STe came some new hardware, and new TOS versions (1.6 and
1.62), but still compatibility was very high. With the Mega STe
came some new hardware (VME bus, 16Mhz cached CPU, extra serial
ports, and on some, a high-density drive), but more of a problem
to some software was the new TOS 2.05 (and later, 2.06). As a TOS 2.06
user, I would have to say the few compatibility problems are worth
the tradeoff for a much better OS.

With the TT and Falcon come not only new TOS versions, but substantial
changes to the architecture of the machine. Not having an TT or
Falcon, and having little exposure to either, I will leave it to
TT and Falcon owners to address their compatibility with most software.

"Ataris use a "Gem" interface, right? I became familiar
with this interface years ago with some PC software based
on it, and I liked this interface quite a bit and was always
disappointed that it never caught on with PC software."

The big problem there was that Apple threatened to sue DRI over the
"look and feel" of GEM. Lacking the deep pockets of Microsoft, DRI
revised GEM to appease Apple, with the result being less appealing
than the original version. There were other factors at work as well,
but IMO, this was the main reason MS-DOS GEM never made it in the
long run.

Compare something like the GEM interface of even TOS 1.04 to the second version of GEM for MS-DOS (such as one will find packaged with the old Amstrad PC's), and you'll see the difference. Compare the GEM of TOS 2.06 or TOS 4.xx on the Falcon, and you'll get a glimpse of what GEM for MS-DOS could have been had it endured.
The closest thing to GEM currently on the PC, IMO, is Geoworks, but if you go hunting for it, you'll note it suffered from Windows Popularity Syndrome (a disease OS/2 is infected with, but has yet to totally succumb to).

2429. Re: Does Warp 9 work on the Falcon?

Message-ID: <hyyZUwr.lmcclure@delphi.com>
Source record: 171395

In a message dated 2-16-95, Fred Horvat said:

"I just got my Falcon and was wondering if Warp9 works on the
Falcon. If so in on the ST resolutions or all resolutions?"

As I recall, the latest version of Warp 9 does indeed work with the Falcon. However, I am certain it does not work in truecolor, and am uncertain if it works in modes greater than 16 colors, which would also leave out the popular 256 color modes.

I have noted that NVDI seems to be the screen accelerator of choice for Falcon owners. It does have the advantage of being actively supported. It recently was updated, while Codehead has essentially stated to expect no further updates of their programs, due to the current state of the Atari marketplace.

2430. ** Atari PC/JAG/Lynx WWW Links! **

Newsgroup: comp.sys.atari.st

Message-ID: <3i42vf$3o5@horus.infinet.com>
Source record: 171396

--==**< http://www.infinet.com/~rbatina >**==--

Please consider adding my home page to your collection. Although it
doesn't contain a lot of original information by me, it has *tons* of links
to information that you may find useful. Here are some examples of what
you can get to, through my home page:

Atari Info and File Links - Jaguar, Lynx, Personal Computers, 2600-7800
Video Game Systems, etc... also in these links
are reviews, cheats, ordering info, ftp sites,
other Atari users, etc...

Commodore 64 Info
and File Links ---- Various C64 home pages, plus several ftp links to
C64/128 files... lots of demos and games. Also, you
can find schematics, pictures, FAQs, etc...

Commodore Amiga
Info and File Links -- Several Amiga related home pages, plus ftp links
to Aminet and other non-Aminet file areas. Also,
links to info on Amiga products, production, new
hardware/software info, FAQs, and other general
Amiga related topics.

Useless/Kewl/Dumb ------ Also in my home page is a page of "Kewl Links"
which you may or may not find interesting...
Including: Pizza Server, Things People Cram up
their Butt, Palindrome Page, Roberto's Candy Bar
Wrapper Collection, PopTart Blowtorches, The OJ
Simpson Page (the good one), WebCrawler, Magic
8-Ball, Mad Libs, etc...

Utilities --- I have included a link to many reference materials,
including dictionaries, area code finders, etc... a
general reference section with all the goodies. Also
included on my home page is the Yahoo Guide to almost
everything, and the NetFind utility for locating the
e-mail address of someone on the 'net. The Figlet ASCII
Font Translator is fun to play with too, along with the
guide to making your *own* web pages.

Misc -- I have included some stuff that is probably just of interest
to me, but I may as well list it here as well. Home pages of
users at infinet.com, info on my girlfriend, pages relating to
Genesis, Tori Amos, and Elton John, a direct link to all of the

MED songs that I have written, Scarecrow's ASCII art archives,
plus a couple others. My personal collection of candy bar wrappers
is also being updated as I get them, on my Kewl Links page...
Feel free to donate a wrapper. :)

So, you can see that this page can be used as a general reference point, if
any of the above topics are of any interest to you. While everything I
listed above is covered, I pay a little more attention to the Commodore and
Amiga stuff, since that is my primary system. However, if *anything* in
the list interests you, please check out:

http://www.infinet.com/~rbatina

Thanks and best regards... Rob Batina

You can thank Atari Corp for the screen interference problem. Since your ST has TOS 1.0, you probably have the Rev. C motherboard. My first ST computer was a 520STfm with Rev. C motherboard and it had those annoying wavy lines. The solution for me was to take it to a repair shop. They failed to fix it. I returned again. They failed to fix it. I return yet again. They finally fixed it! They did a modification to the video in the ST. Unfortunately, it was so long ago I have forgotten the details. Also, I can't examine my 520STfm because I sold it after the video display problem reappeared and no amount of hacking could fix it again. I then bought a 1040STf with TOS 1.2. I checked the motherboard and it is a Rev. D. The video display is excellent! There also isn't any of those annoying permanent up and down lines that go across the entire screen. Strangely enough, my brother has a 1040STf with TOS 1.2 and his video display is excellent! What is even more bizarre, after Atari Corp fixed the video problems of the previous motherboard, they reintroduced them with the 1040STE machines. I have seen only one 1040STE with a good video display. The three other STE machines I have examined have had video displays with wavy lines and those permanent vertical lines. My conclusion is that Atari Corp has not been paying much attention to quality control with their ST machines.

You should have seen my mail! "RTFM - if you don't know what you are doing,
you shouldn't be here," was quite mild. Constructive criticism, such as
yours is what was posted, and I thank all those who took the trouble.

However, I feel that you have gone slightly off-target towards a better
discussion. The "8+3 or longer" debate is only part of the problem. You have
yourself impinged on the basic problem - progress. The only problem is,
we're going backwards. I'll explain my thinking.
Way back in the mists of time, (when Sir Clive were a lad) computers had
valves (tubes to you Yanks) magnetic ring memory, and each instruction was
fed in by setting individual switches. Progress has taken us through the
electric typewriter interface to the screen based VDU, and programs have
gone through punched cards, paper tape, magnetic tape, magnetic disks (which
have shrunk -I think the earliest floppies were 10") to CD. Switches have
moved on to keyboards, from basic 40 or so keys up to the 100+ on a modern
PC, now we even have pens and handwriting recognition. In terms of ease of
use the biggest leap forward in recent years came when Rank Xerox developed
the WIMP interface. (Incidentally, they were worse than Atari at marketing
a Good Thing) which was immediately seen by Apple as the erstwhile Good
Thing, and they built a (fairly) good computer around it. Atari also saw it,
and saw that it was Good and built a better computer - faster, cheaper,

better display capabilities, and so on, and more to the point used (they thought) an industry standard disk format; because Big Blue, in their wisdom had developed an anachronistic desktop computer that used an interface that needed almost a degreee in computer science to understand - but the world bought the badge, and therefore the computers - in their _millions_!
Since then the world has moved on. PCs now have a Window on the world instead of DOSsing about, Apples have come slightly down price albeit still staying upmarket, while we, the Atari users in the forefront, are going BACK to the keyboard/cli interface that IBM has now dropped!

What's the point of all this? Simply to illustrate that aping the format of mainframe Operating Systems is NOT progress; it may be necessary to deal with it, but we should not have to copy it. By all means argue that 8+3 is effectively dead, but so is the command line. If you we want to progress, why are people with the skills not working on a graphical interface for the net. I know that keyboard skills are still needed, but they will alway be needed while ever we have text. This is where your argument about graphical interfaces falls down. What we need is to avoid the housekeeping chores. If you like it's akin to wanting an automatic washing machine to replace the tub, washboard and wringer (whaddyamean wot's a washboard?) This is precisely what the GUI does. It removes the tedious routine chores and leaves you free to concentrate on the task in hand.

Take a nice simple operation, selecting a file on a UNIX setup:
-cd /(must remember SPACE then FORWARD slash)
topdirectory/subdir1/subdir2/subdir3/file <rtn>
- Not a valid file or Directory
- What? oh sh*t, there's a capital in there
- cd \(bugger)b/sp /topdirectory/subdir1/subdir2/subdir3/File <rtn>
How much simpler to:
click(fileselector) click(drive) click(topdir) click(subdir1) click(subdir2 click(subdir3) click(File) click [OK]
No worries about spelling, case or anything, because the information displayed is read from the machine. Even better, it stays there for the next time you want to use it. If text based operation is so good, why the hell do so many people buy Apples, PCs that run Windows, Amigas (sorry) STs and Falcons, Archies and NeXT. EVERYTHING uses GUIs now. When are we going to learn you don't progress by going backwards. I'm sorry if I'm repeating myself but it has to be said.

I'm a user, not a programmer. If I were a programmer, I wouldn't fix cars for a living, so I have a little more trouble than many in converting from a nice modern GUI to an antediluvian CLI to troll around the net. In fact this is a classic example; it's a rewrite of something I wrote at 6am today (that's the only time my host is quiet enought to get on the news server) then went to save. Except I hit ^C (close, no save) instead of ^Z (save then close) cos I'm not a typist. Much more difficult to get it wrong with GEM.
Why is it that when some enterprising programmer writes some useful software for the Atari to use the net, it's written to suit the net, not the Atari? _I_ don't mind paying reasonable fees for good software; I resent paying a

small fortune for crap. I'd register a lot of shareware that I don't use if it weren't paying more to the banks than the authors! I believe part time authors should be encouraged, but I also believe that they should write what we need. Maybe I should try buttering up Dan Wilga; he's the best I've come across so far for utilities. (apology to all the others whose work I don't know)

All I am trying to say is that we MUST get up to date. Changing from GEM to UNIX is not the way to go, IMHO. Hiding the UNIX may be.

Bob, trust me on this. GET THE 3.5 COMPILER. You'll thank me later. It
is leaps and bounds better than the buggy 2.0 version. Besides, you lose
tremendous functionality in 2.0. Ever since 3.07 you could write REAL
GEM programs, on the par with Pascal and C ones.

It's worth the dough.

Subject: FORSALE: 520st, (Jul '85) sc1224, 1meg
Organization: University of Wisconsin, Milwaukee

As the title states,I have a 520 st made in July of 85 forsale,
it includes:
ez-ram II 1-4 meg upgrade
Tos on ROM, version 1. something (one of the first)
An original sc1224 color monitor
720k drive

Software:
Dungeon Master I and II and probably some other goodies

Make me a reasonable offer, please!

Also:
1 panasonic 1091 printer
and
1 citizen 200 gx 9 pin dot matirx printer (color upgrade not installed
but still available)

Peter, YES IT DOES MATTER! I happen to have a beautiful PowerMAC and boy do Native code applications fly. To give you an idea of how fast these are. The PPC EMULATES a 68020 processor, and averages (in emulation) about 20-25 MHz throuput. Remember how slow "PC-Ditto" was? About 1MHz for only 8086 emulation. Now picture an Atari Emulator executing in native (not emulated) code for all TOS functions, and emulating 680x0 code. Get the picture? The "slow" models of PPC (60MHz RISC with 64bit memory) are at least 8 times faster than a TT. Now, add in a "typical" Apple display (640x480 True Color) and you have one serious TOS machine.

I do not see why Atari doesn't make (or at least endorse) PPC based TOS machines.

There's something a bit sinister about me being able to run a Mac application (or a few) in a window and have MS-DOS and Windows running applications in another. Now, with a TOS emulator I can have all three computers in one box.

The P60x series of processors are so fast (being RISC processors it helps) they can emulate just about any system at an equivelent or greater speed than the system it is emulating! Apple's latest model uses a P603e processor running a 100MHz! Now let's see...8 MHz vs. 100MHz...tough decision!

Don't get me wrong I still have my ST (and am using it now), but man would it be nice to see TOS running on a PPC. 8-O!

By the way, I can't wait to get a Falcon....

Simon, you need to put the following in you AUTO folder (in the order shown):

DRVIN.PRG
SCC.PRG or SCC_X.PRG or SCC_FALC.PRG (depends on version).

BOTH have to be in the AUTO folder to work, and in that order.

: have one? "atari.archive.umich.edu" is off-line at the moment.

: Thanks,
: Joshua Scholar (jscholar@ccnet.com)
Joshua, are you serious?? Are you REALLY not kidding?? Of all of the programs available for the Atari ST series, I believe RAM disks take most of the majority. Pick ANY FTP sight and yous should find one in a "utility" or "diskutil" directory. I guarantee you will find bunches. However, since the Europians seem to worship RAM disks I would assume a UK or German sight would have the best selection.

Personally, if you want a simple "dirty" and fast installation of a RAM disk, then just get one that is a "TTP" application. Accessories and others just hog memory if you are short on it. Besides, what difference can there be in functionality of a RAM disk???

Good luck Joshua, and smile!

There is. But first i would like you to either dump Hsmodem6 and get Hsmodem5
or get the updates, cause there seem to be a problem with hsmodem6.
When you use it on your Falcon you need the DRVIN.PRG and the SCC.PRG.

IMO, the ST is _very_ sensitive on the p-port. No buffering whatsoever.

I wouldn't use more than 5 meters. I've seen a couple of machines, which were
damaged when a printer was connected via a looong cable, and the printer was
turned off during use.

I played with SlipKnot on a 486 PC + Windows. It just works on a
standard UNIX account and gives almost the same as Mosaic.
You should try it if you can.

I am almost sure it is possible to create something like this for
the average Atari ST (Maybe 4 MB is required) running under GEM.

If a team of enthousiasts could be formed (people with programming
experience) around the world, it could probably be accomplished in
a relatively short period.

A lot of the buildingblocks are already available on the ST.

Who is interested?

Henk.

Please do not reply to me personally, unless you would like to work
on it.

Again, I have to wonder out loud, _why_ would anyone bother running TOS
on a PowerPC chip? 100% of software (including system software, unless
somebody wants to port the large sections of TOS that are still 680x0
assembly to PowerPC assembly or C) would have to run in emulation, which
means your snappy new PowerPC system would run about as fast as a 25Mhz
68040 system... and if you're going to do that, it'd make more sense to
run a 68040 system.

I've got to wonder about DOS, too, unless it was running on SoftPC; DOS
is 100% 8088 assembly AFAIK (gathered from Microsoftie comments on the
'net) and would be in a similar emulaton state...

I'm certain I have to run HSMODEM before Mint, that seems to work but
it still does not allow me to choose 57600 as a valid baud rate on
Serial2 (or any serial port). Even the remapped values don't work.
So is there a way to get HSMOD and Mint to co-operate? Or is there
a small auto folder utility that can set the baud rate after Mint
has loaded to 57600 so I can have pppd just use the default baud
rate instead of trying to set it? Once I get Gcc up and running
properly I suppose I can take a crack at it myself. BTW, the last
GCC I downloaded was 2.5.3 (or something close to that). People
have mentioned that the 2.6.x have problems. IN fact I've heard
I should go back to 2.3.x for better realiability? Is this true?

Thanks,
Sam

But if you run Xwindows under mint and have a PPP or SLIP connection
to a system which runs XMOSAIC, you can use it and it is VERY useable
on 14.4 modem with compression.

2467. Re: Atari - What is it for really?

Newsgroup: comp.sys.atari.st
Date: 1995-02-18 22:11:25 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <17349C796S86.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 171311

Why would anyone want to buy an Atari?
But is there any other reason that one would want to put up with
such a small company?
For some reason, Atari is popular in Europe. Maybe someone could
give some reasons for that. (Even if you don't need a reason.)
JAH

To briefly answer your questions, AFAIK, when the Atari ST first came out in the mid-'80s, it compared very favorably to the Apple Macintosh, which at the time was a slow, squat, boxey, expensive machine available only with a B/W monitor. IBM PC's were outrageously priced, and worked only with MS-DOS (Windows wasn't even available yet.) The ST, on the other hand, was reasonably priced, and many considered its TOS a superior operating system. In Europe, apparently computer users simply compared computers, considering what you got versus what you paid for. Even against the Commodore Amiga, Atari was the clear winner for many users. However, Apple, IBM, clone manufacturers, etc. had good marketing, while Atari had inept marketing. Atari tried to keep up with the larger manufacturers, but they always seemed to be too little, too late. For all intents and purposes, the Atari computer market is dead in the U.S., even though it's a good machine, and there are reports that small quantities of Falcons are being manufactured. Why would anyone go out and buy one today? There's no good reason to, as far as I can tell. Current owners, if they are ingeneous, and still get a lot of use out of their Atari compuers, but if I were to go out and buy a new computer today, I'd buy a PC or a Mac. No brainer. However, the MIDI application might be a reason for some to go with Atari. Hope that helps.

I'm not into bashing other computer systems. I own and regularly use four different computers. A Mega ST4, a Falcon 030, a Mac PPC 8100/80, and a Toshiba 486DX2. I use the Mega ST4 for MIDI applications and a BBS. I use the Falcon 030 for dtp and MIDI/hard disk recording. I use the Mac for desktop video and graphic design (and some MIDI.) The Atari's are my personal favorite for MIDI. The timing is always rock-steady and the available programs will suit my needs for a very long time to come. Hard disk recording on the Falcon (using Cubase Audio with the FDI & FA8) is fantastic! The sound quality IMHO is pro-level. I am not sacrificing quality using the Atari for my sound needs. The Mac serves as a wonderful video editing platform and is nice for cruising the 'net. I'm still trying to figure out what the IBM-clone is good for. If anyone knows send me an email! :)

Seriously, it's very shortsighted to criticize other platforms as each have thier unique strengths. If my only concern was games... well then I think I'd have to own a Jaguar, 3D0, and a SEGA. But that new Donkey Kong for Nintendo looks kinda cool too!

Long Live Atari!!!

I have been given a Genius serial mouse for IBM compatible.
It has the same plug as the Atari mouse. I have a dead Atari
mouse. Is there any way I can adapt the Genius mouse to use
on my Atari or should I pass it on.

Thanks

Alyre

Try 'ftp.phil.uni-sb.de:/pub/atari/linux/', there you will find a mirror
of tsx-11.mit.edu and some precompiled binaries...

A Falcon kernel binary will be available soon, too!

2476. Re: Please answer a stupid question...

Newsgroup: comp.sys.atari.st
Date: 1995-02-19 01:06:00 UTC
From: Martin_Reitzlein@gi.maus.de
Message-ID: <199502190306.a3939@gi.maus.de>
Source record: 171321

it's /not/ a stupid question, so let me try:

-st[e] 260, 520, 1040 [fm]

f=internal 720kb floppydrive
m=internal tv-signal-modulator (you can connect yor tv - good for games)
e=enhanced (i'm not shure about the interpretation. but: newer = sound and pictures are better if software supports - there is a few, especially games)

520 was the first - 10 yaers ago.
68000 cpu.
tos (operating system) 1.0 - 1.62. 1.4 (1.04 is "official" spelling) is today's minimum).
it's expensive to connect a harddisk.
loads of software of all kind. the good ones are supported even 'till today.

-mega st 1,2,4
same as above, but but numbers stand for ram in megabyte, not kb. a little faster in graphics (exept the [e]-type). much better keyboard. easy to upgrade with a lot of things (graphics, speed, i/o-cards etc) wich are hard to find nowadays. nevertheless: low-budget-recommendation.

-stacy (laptop), st book (notbook)
nice, seldom, expensive.

-mega ste 1,2,4
16 instead of 8 mhz system-speed.
using common ram-simms (quite cheap)
tos 2.05 and 2.06 (quite bug-free)
space and interface for one(!) internal scsi-harddisk.

-tt
best and fastest.
68030 cpu.
tos 3.05 and 3.06.
internal grapics up to 1280x960 b/w
internal vga graphics.
up to 256 fast ram. also 2-10 mb old ram to be compatible, but it isn't (as far, as you want to play).

-falcon
newest and most colerfull, very good sound, but slow in comparison with tt.
tos 4.0x. some very interesting software wich uses the internal "dsp-chip", so it does'nt run on the older ataris.

RJG>Ataris use a "Gem" interface, right?

yep. and if the software really does, it should run on every atari.

RJG>ST's seem to be pretty cheap.

this is not new. softwar-prices are low as well.

gruss, martin .

jamesw@CSOS.ORST.EDU said:

> I've heard rumors that some of the older games won't work with a new

True. Some really old games only work with TOS 1.00 or TOS 1.00-1.02

> Which version of TOS begins the incompatibilites, if any? Is TOS 1.04

Each TOS is incompatible to some extent with the one before. Most of the
time it doesn't matter as software is far less TOS dependent than it used
to be.

> way to install more than one version of TOS and switch between them?

There are TOS switchers which may do the job - but quite honestly unless
you are really addicted to a certain very old game (were talking 1987ish
here), then TOS 1.4 is pretty safe.

:-)

2483. Connecting Stfm & Pc together ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-19 04:14:52 UTC
From: simon@kingres.demon.co.uk
Message-ID: <793167292snz@kingres.demon.co.uk>
Source record: 171295

Does anyone know the best way to connect a Atari 520 STfm and a PC 286 so that I can transfer files from one to the other ?
Can I just connect a cable from the serial port of the ST to the serial port of the PC ? And use comms progs to send the files?

Or is it possible to connect them so that they can access each others hd's, modems, etc ?

Any help would be appreciated.

Source record: 171344

There was really only one things that stuck out in my mind about my atari, well I still have one, and run a Atari BBS, but I am talking about when I bought my first ST back in 1985, and yes it was the one without the internal disk drive and power supply, kinda like my old 800xl. Anyways, everything was great for about one year, then the disk drive went out on me and I sent it to Atari to get repaired, and as most of you know it takes about 6 weeks, and you usually get it back not working. I sent it back and got supposedly a new one, but this one would not read some of my existing disks.

Needless to say I scraped the Atari 354 SS and got a great deal on a Indus GT double sided, which works 'till this day, with its sometimes usefull sector read out.

Well I am sorry if I wasted some bandwidth here but I really like Atari computers, and wish that they were repaired with a little more confidence.

BTW - I was reading news clips from the Feburary 95 Computer select, and searched for Atari, and in a article with the head of atari, saying that '1987 was Ataris record breaking fiscal year with a total of $500 million is sales.' With this in mind, and knowing that in 87 they were producing computers, not game systems, why would they go with the Jaguar? Just a thought...

Howdy. I recently purchased a 520st with the single sided external floppy just to get a taste of what these machines are like (I still use my atari800 sometimes). Seems pretty cool, the only problem is I'd like to know if it's possible to do a simple modifaction to these drives to use double sided disks. Can I just add a double sided drive and change a few jumpers or something? Also the disks that came with the computer seem to be pretty old as they don't always load and many won't load at all. I thought it was probibaly the floppys but I formatted a newer double density disk and then copied some files from a pc to it (on a pc) and only a few of the programs work. Are the unarc and unzip programs on the pc the same as on the atari? Or could it be a problem with the pc writing to a single sided disk? Well, any help would be great. I tried to find some info on this drive but no luck and I don't have any books for this machine at all.

Thanks,

Andy

It was none other than Kim Andersen who wrote on 13 Feb 95 that ...:

KA> So, where is this so called Magic for the Falcon ?

Don't get me going :-(

KA> telling us all when these so called 'few weeks' are going to be. A few
KA> weeks easily turns into a few months, (which we now have seen), and
KA> next is a few years.

Sure I am getting extremely anxious about this aswell , last I heard they were adding loads of new things to it so it was going to be delayed. Now I am all for complete ,fully featured and properly tested products and everything from 2B always delivers that but in this case I think there is defintely a case to be made for a V2.99 to be done so that we Falcon owners can get the use of our Magic again !!! Surely a few quick changes to make it Falcon compatible isnt going to be do any harm and will save a good few of there potential customers giving up and going elsewhere (like you add later) . On this later point I have heard a rumour that there is in fact a re-engineered version of Magic 2.01 been seen that does work on the Falcon ...

KA> Actually, Magic for the Falcon is the only thing holding me back
KA> from selling my atari equipment and change to a Pc. But you probably
KA> don't care about that anyway.

Well I care and hopefully so does 2B . PLeasee,please ,PLEASE make us happy again and release a Falcon conmpatible version of MAGIC soon !!!!
Without all the fancy additional stuff or even manuals or any gaurantees at all if need be as a short term solution !Anything is better than NOTHING at all :-(

Owen is right!!! What about all those CONFIG.SYS and AUTOEXEC.BAT files? Well, EVERY PC I've had (past tense...don't have one now!) Was full of irritating quirks. NOBODY could suggest how to fix them. Problems like the clock mysteriously resetting part of the time....problems like mysterious LOCKUPS.... Playing Wing Commander and having it dump you back to DOS at random. Windows "General Protection Faults" in a game... Some of my Windows problems would allow me back to the desktop, while some would *REBOOT* the machine.

I got tired of this, and I got rid of my LAST PC. Who do you call when you're playing a Windows game, and it freezes? WHO???? Problem could be with: 1) Windows itself
2) the underlying DOS
3) Memory managers...like HIMEM.SYS or EMM386.EXE or QEMM
4) The video card driver
5) The video card
6) The actual game

Who do you call? How do you know? There are SO MANY BLASTED DRIVERS "stacked" upon each other by the time that you run your application, combined with a motherboard by these folks, BIOS by those folks, video card by what's-his-name.... Incompatibilites obviously exist. NOBODY can help you when this happens, because NOBODY knows. Call up the place you got the PC, they think you're just an inexperienced user. What can they do over the phone, anyway?

I enjoyed it for a while....the CD-ROMS were interesting, but after a while, full-motion video (on a TINY window) was no more interesting than watching TV, except that there's usually something better on TV. Flight simulators were the best PC games....the PC joystick is useless for other types of games. The multimedia games are fun the first time you run them, but *ALL* get monotonous as they play the same little clips over and over.

I'm going to stick it out with the Atari, which plays more games that I enjoy, and meets my other needs, anyway - word processing, programming, and telecommunications. I'll also "wait and see" what happens with the Power PC computers. The Power Mac is a nice machine, but there's a software dichotomy; if it runs on a Power Mac, it won't won't on the others, so the PPC software market will be small for a time.

Be nice if Atari was to unveil a Power PC box; imagine if it could run TOS, along with SCADS of other operating systems. If Atari had the resources and ability to develop a PPC computer, I'm sure that droves of former Atari-loyalsists, as well as those who use Atari computers now, as well as those who do not, would be attracted. I'm probably dreaming, but I wonder if Atari knows of the loyalty of Atari users.... Probably not, or they wouldn't have bashed us so much in the past. A shame....such loyalty is VERY profitable for other firms....and probably not as strong as Atari loyalty.

end.

James

Henrik,

APEX Media is an animator, it is NOT a paint/touch up package. As far
as I can remember autodesk animator doesn't exactly have an anti-aliasing
feature either, I may be wrong of course.

In most cases re: video and animation anti aliasing is not required,
a simple blur is enough, unless you want to produce video for your desktop
computer this problem is easily solved for putting animation onto video as the
transfer already offers a kind of natural blur which is sufficient for
anti aliasing.

For 3D animations, the aliasing is often already provided in the
3D rendering system.

Cheers

Mike Wasinger (mwasinge@nyx.cs.du.edu) wrote:

: AN ATARI ST HACK IN PROGRESS

: Episode 1: Hard Disk Questions

: Whew!

: I've just finished mounting my 520 ST w/ 1 Meg RAM and SH204
: 20 MB Hard Drive into an IBM XT case! (Tight fit!)

: Finally, I can turn on my ST with only one power switch!

: The real reason that I performed this lobotomy (and it was
: a sloppy surgery; many of those Atari connectors are impossible
: to find... you would die laughing if you saw my homebrew video
: connector) is that I wanted more space to upgrade my ST. Another
: reason is that my Powerbook 170 is now my primary computer and
: I can afford to take some risks with my venerable old ST. There
: is now room to add an extra hard drive and more memory expansion.
: There is also room to mount other boards, hopefully which I can
: design and use to interface the ST to the real world (A/D, D/A).

: My first set of questions (of several that will follow) have to do
: with the Atari Hard Disk Interface.

: The ST and SH204 are connected as follows:

```
: +----------+ +-------------+ +-------------+
: | 520 ST | 19 pins | Small board | 50 pin | Large board |
: | DMA chip |<------->| at back of |<-------->| over actual |
: | | | SH204 | ribbon | HD media |
: +----------+ +-------------+ +-------------+
: | |
: 2 smaller | |
: ribbons | |
: +-------------+
: | 20 Meg HD |
: +-------------+
```

: (1) What signals are on the 19 pin line?
: ASCI ? (What is ASCI and how is it different than SCSI?)

How is German different than English???

:
: (2) What is the 50 pin cable?

It's a standard SCSI interconnect cable.

: (3) What does that small board do, and what is it called?

It is an ASCI to SCSI host adapter.

: (4) What is the large board over the drive? Does it convert
: SCSI to MFM or what? What is the board called? It has
: an extra ribbon cable header. Is this used to hook up
: another drive as I have heard is possible with the
: SH204?

It's your HD controller. Most likely it says "Adaptec 4000" on it. It
is a MFM controller. Yes, it converts SCSI to MFM (somewhat).

: (5) How could I hook up an unused SCSI drive (from an old
: Mac) into this system? At what point does it get attached?
:

Yes, you SHOULD be able to connect a SCSI drive in the same path (50 pin
cable) as the controller. That means you must have a 50 conductor cable
with three connectors on it. One for the host adapter, one for the MFM
controller, and one for the Mac drive. Your controller for MFM should be
set on a different address than the mac drive. That means if you are
booting off of the MFM drive, then the controller should be set on device
ZERO and the mac drive on device ONE.

: (6) I read in an article about MacMagic that this new Mac based
: ST emulator could read/write to Atari HD's hooked up to the
: Mac's SCSI port. Does this mean that the 19pin port on the
: back of the SH204 is true SCSI?

NO, it is not. That's ASCI and extension of the Atari's DMA port, for
daisy chaining. The SH204's host adapter (small board) is as close to true
SCSI as your setup is going to get.

: (7) Will only MFM drives work attached to the large board?
: What drive mechanisms will work with the SH204 controller
: board? Where can I find the format parameters for use in
: Atari's format program datafile WINCAP?
:

Actually, MFM and RLL drives will work, but the RLL drives will only be
in MFM mode and lose about 1/3 of their advertised space. RLL drives are
just "better" MFM drives certified for use with an RLL controllers.

: (8) What are the recommended means of speeding up HD I/O given
: that I am using TOS 1.0 in ROM. What PD programs are helpful.
: How much is TOS 1.4, and where can I find it?

Upgrading to TOS 1.04 is your best bet. It's typically about $60. Toad
Computers sels them for $59 mail order.

You could use "FATCACHE" or "FATSPEED" to speed up TOS 1.0. Also,
"PINHEAD" 2.1 is good for program load-to-execution time. They are

Public domain or shareware and on most ftp sights. However, TOS 1.0 is
still buggy. Get 1.04 it's much better.

: Any help that this conference could offer would be most appreciated.
: I read this area fairly regularly, but I would appreciate e-mail
: responses as well as posts.

: Mike Wasinger
: e-mail: mwasinge@nyx.cs.du.edu

: UPCOMING EPISODES:
: Questions about building a memory upgrade board using SIMMs.
: Questions about the MMU & GLUE and adding extra mem-mapped I/O devices.
: Questions about replacing the 8Mhz 68000 with a faster chip.

: :x

: A
: A

On All atari drives using a MFM or RLL mechanism you will always have a host
adapter which is connected to a controller which is connected to the drive.
Typically the host adapter converts ASCI to SCSI and the controller
converts SCSI to MFM or RLL. The only Atari drives that have the host
adapter and controller on one PC board were the Megafile series. They
had an Adaptec controller built right in.

: run fine as long as you swap to the TOS 2.06 roms? Also, if you did this kind
: of an upgrade how much would it speed up the computer and how would it expand
: its capabilities?? oh, and how much do the 68030 and TOS 2.06 roms cost at
: this time...?

: Jack Deth
:
Absolutely, positively NOT. The 68020 and 030 and 040 are vastely
different processors. They are all true 32 bit processors with lots more
pins, instructions, and timings. Frankly, it's like droping a jet engine
in a Yugo. It's a most difficult project. The ST bus requires extremely
strict timings which the 8MHz happens to follow precisely. The other
processors do not work (timing wise) the same as the original 68000.
Besides, they have a 32 bit data bus and a 32 bit address bus and the
68000 only has a 16 bit data bus and 24 bit address bus. Besides, the
big processors would just step all over the critical timings of the MMU,
GLUE and shifter chips. They are not handshake friendly.

The trick is to fool the ST bus into thinking it still has an 8MHz 68000
plugged in and not a "Ferrari". That takes lots of logic chips or a few
well programmed PAL/GALs. You also need to have a a minimum of TOS 2.06
to use the big processor. The 020 etc. have a vastly different
supervisor mode with a much larger stack frame. TOS 2.06 recognizes this
and adjusts appropriately.

Now, 68030 upgrades are available and I can understand their minimum
price of $300. In my opinion $300 is a bargain.

Rob, the "General Purpose Output" is an extra bit from the Yamaha sound
chip that is not used. Atari put it to the monitor port for your use.
However, it is no longer available for Falcon machines. On the Falcon it
is used to toggle the internal speaker on and off.

Your composite sync is available on ST's with a modulator built in, or
can be created with two resistors, two diodes, and a one transistor. The
whole project to built a composite sync extractor is contained within the
OVERSCAN project on most ftp sights. If you have a modulator, the the
composite sync is usually on one of those pins going to the modulator.
Also, pin 2 of the monitor connector has composite video (if a modulator
is installed), but the sync is easily extracted with a diode.

However, before you connect this monitor, MAKE SURE IT IS COMPATIBLE WITH NTSC (or PAL if you are in Europe) sync signlas!!! Otherwise, you could blow it to the moon!

: Here's another one: What the hell is the AUDIO IN and how do you use it ???

: S.Lai

It's exactly what it says. It allows you to mix another audio signal with the monitor audio signal. It goes to the audio pre-amplifier which goes to the monitor and modulator, if you have one. IT IS NOT AN INPUT TO AN A/D CONVERTER. It's just a way to hear two things on your monitor. You could connect your modem's speaker output to this input and hear your modem on your monitor instead of the modem. This way you can control the volume.

Basically, it's not too useful.

Just go to your local Macintosh dealer and get a mac SCSI CD-ROM drive.
They are fairly cheap (at least here in California). It should work fine
with your Falcon's SCSI-2 interface. Mac uses the same thing. However,
you will need to acquire drivers to use it with your Falcon. ICD has
some excellent software for just such a purpose.

I see others posting about CD-ROMS for the ST. Does anyone know if there's actually any software out?????

Is it possible to get Microsoft Bookshelf for DOS to run on the ST through a PC emulator? If I could get that to work, I'd buy a cheap CD-ROM for that reason....the online dictionary was fun.

What about the encylopedias and other reference works? Since most of the disc is data, is it POSSIBLE for someone to write a reader program for the Atari ST to put in Microsoft Encarta and search through it? Probably none available, but is it POSSIBLE? Sounds great, doesn't it? I wish I was a programmer.

: around - I've never seen one.

: Get a life - get a PC :)

So, you are saying that a computer with the most backwards and patched early 1980's OS is the best around? Dos still is limited to 640K there's no way around this. The memory map is STILL based on a 1 megabyte system. The only way to gain any more memory is to have special drivers to use memory above the 640K limit on 286, 386, 486, and P machines. All code is only executed out of the conventional memory after it is dumped from the "expanded" memory. display memory is only accessed in "window pages" via a locked clock fixed bus. Expansion is a nightmare due to no set standards on IRQ, DMA, and port settings. Windoze is so slow because of its poor programming that to get any use out of it you must have a machine that is 33MHz or better just so you don't punch holes in the screen while you wait for it to do "housekeeping tasks". Sure, when one program crashes they all crash and kiss off any recovery. Also, if you have a Pentium, then you find you have a $900 random number generator for a CPU.

Listen pal, the PC has only syurvived because IBM bailed out corporate america when CP/M failed and they have had it ever sense. IBM failed when they designed a system with zero expansion capability and locked in a design that was sure to be outdated.

You will find that IBM is trying to change that with their PowerPC line to REPLACE the far outdate MSDOS/WindoZe line. Frankly, you couldn't pay me enough to get a MSDOS/WindoZe computer. I would much rather get a PowerMAC with a design that was always intended to be expanded and not patched around and limited. The macintoshes are very similar to the ST's with expandability and the capability to use just about any display, bus, and device connection. The hardware is designed for the vast variety of peripherals of the future.

I happen to have a 2.5 megabyte ST and a 16 megabyte PowerMAC that blows you DOS box out of the water in performance and speed. Heck, my powerMAC can run WindoZe in a window while I run mac programs in others. All at a speed equal or better than a 33 MHZ 486. There's not design limitation for expansion. I can add SCSI devices, I can add LINEAR CONVENTIONAL MEMORY on board to 72 megabytes and no special drivers are required. I can actually click on a drive right on my desktop and use things. I do

not have to go to a special "File Manager" and install special icons and tell the Program Manager I have another program just so I can use it.

Just because lemmings run to the water doesn't mean that the water is safe.

Just because lots of people buy DOS boxes doesn't mean it is the best available. Frankly, Atari is not the best available, but it is much better than a jury-rigged DOS box regardless of the CPU installed. It's not the processor that makes the computer. It's the design of the computer. A 90MHz Pentium system is just like a blower in a Yugo. When all is said and done it's still a Yugo. MSDOS/WindoZe and the hardware design are what hurts the DOS boxes. You could redesign the DOS boxes with a new interface and bus design, give them a new operating system (you can still have a command line interface) and use the same CPU's (except Pentium's they are a joke), and you can have a very impressive computer. Get rid of the XMS drivers, extended and expanded memory, bogus IRQ port settings, and segmented memory accesses and you can have a great computer. Right now they are pushing maximum density. Raw speed still can't cover up poor design.

Apple and Atari have the better design period. Atari hasn't built upon it and that's their fault, but Apple has and have some great computers that are fast and up to date. If Atari would just take Apple's lead, then they can also have one very serious modern computer. An Atari PPC would be a nice system, but oh well...

Get a life pal.

: --

: Simon Moore
: smoore@chowgar.demon.co.uk
Simon, MFP_FALC.PRG is useless on a Falcon if you haven't hacked a new
serial port off of the MFP. On the Falcon the MFP is not used for
serial. IT's too error prone (as ST users can say if they want any speed
greater than 38400 bps). What you need is SCC.PRG and not MFP_FALC.PRG.

DRVIN.PRG
SCC.PRG

Those are the two programs that you need for your Falcon, and in that order.

The Falcon uses a SCC chip for serial and is a MUCH BETTER chip than the
MFP for serial use. You can have speeds of 115200 bps without any
problems (as long as you use SCC.PRG).

This sounds a newer printer than mine, which is a Brother HL4V. This emulates the Laserjet 3 and most programs have a suitable driver, either included or available for purchase. I don't have the specific programs mentioned, but haven't had any problems with the programs I use and a Laserjet 3 driver.

>

At the risk of sounding bitter, which I am, I'd say that the reason that Codehead hasn't sold many more copies of Warp 9 has a heck of a lot more to do with the poor support from the Codeheads themselves than with the state of Atari. Charles Johnson in particular I find quite irresponsible in the amount of B.S. he spouts about "how bad the Atari marketplace (supposedly) is". At the time that I decided to buy NVDI, and I doubt this has changed, Warp 9 didn't work with Speedo GDOS, That's Write, Falcon Truecolor, or MultiTOS! Okay, so why the heck should I buy it? It doesn't work with my system in 90% of the setups that I boot into! Yeah Chuck, that's the fault of us consumers. Good idea. <grumble grumble grumble>

Sincere apologies - I didn't mean that to come out the way it looked; now
I've excised the important stuff, does the final comment make more sense?
I've had enough trouble with my system and asked for (and received) so much
good advice that it would be churlish in the extreme to insult another in
the same position. You gotta admit, your header line does make one wonder??
Maybe I should engage brain next time before putting keyboard into gear?
I think Hendrik's "Virtual hug mode" is called for :-)

I wish you well with your efforts.

mike@medsun.unige.ch "Mike Morris" writes:

> <Confused> Does HSMODEM need a hardware modification? Or is
> it software only?
>
> Mike Morris
>
The only safe answer is "yes and no" As I understand it, HSMODEM does two
things.
First is to write improve serial port routines into the OS tocure bugs,
improve throughput etc.,
Second is to enable you to use higher speeds through the serial port.
However, in most STs this requires a (small) hardware hack as the standard
serial port driver is limited to 19k2. The hack will allow you to double
that. I gather that Falcons can already handle the extra speed, but a Falcon
owner will be able to tell you for sure.

Hope that helps

2511. Falcon: SCSI chip questions/ Akzente INFO?

Newsgroup: comp.sys.atari.st
Date: 1995-02-19 12:56:59 UTC
From: contacts@mits.mdata.fi
Message-ID: <3i7f6r$ark@prime.mdata.fi>
Source record: 171292

A friend of mine just got a new Falcon from Akzente (Ulm), and it's SCSI bus is not working (even pre-formatted (in my Falcon) disk give grabage as ID-text, and bootup locks. Luckily he's 0.5 Gb Quantum Maveric was not damaged by testing, and he has 170Mb IDE in Falcon as well. But: no SCSI means no Cubase Audio! :-(

As he does not want to have anything to do with the Akzente (Ulm) -company (the deal delayed 2 months, and CD-rom and ScreenBlaster II has not arrived and SCSI -chip is broke and...) which by the way does not even reply to any faxes after they've received the money, we'll have to solve this problem by ourselves.

1. How to find out which SCSI-chip is needed (I've heard there are 6 different types? Is knowing the serial number of the machine enough for ordering the right chip?
2. How do you really know that the problem is the SCSI-chip, and not the SCSI-kit tower-extension card?
3. If you know any Atari dealer, who sells there SCSI-chips, please let me know ASAP.
4. If anyone of you lives near Ulm, Germany - please give a call to Akzente (0731/22551) and tell them that the'd give any sort of reply to mr. Suomalainen/Finnland; if they have something against dealing with foreigners, or the flood has caused problems to their business: please let us know! They seem to lack all civilized manners of the business world.

Thanks,

I doubt it. Not directly anyway. It _may_ be possible to convert it, but I don't know how. Anyway 3party replacement mice are cheap enough these days - you can get them for a tenner in the UK, and better than the Atari one.

best of luck

> regular sites.

The program you need is available at HENSA in the directory
called tools or utilities (can't remember which off the top
of my head) in /micros/atari. The file's called gzip124.tos
(please check for capitalization in all of the above). It's
a self-extracting archive. The program itself is a TTP and
you run it with the appropriate switch (I think it's -d, but
check the copious and confusing docs!). So you'd enter:

-d path\filename

in the command line dialog box when you run the TTP. I've
installed it as an application so that double-clicking a file
with the .gz extension unzips the file without having to
remember the above, hence my somewhat hazy recollection of the
switch etc :-)

Hope that helps.

> ---> Please respond to the e-mail address below
> George
>

There's all sorts available. A mate of mine runs one on QuickBBS. A tad
slow as it's written in compiled Basic, but it works well. Bags of
features, handles nodes and nets and mails, ANSI 100 emulation, generally
doing everything a good board should. Should be available on the regular
sites. Try it out if you like, on (44) 115 979 7522
Failing that, Octopus, Ratsoft/ST, or ProBBS (no longer supported by the
author). Michtron BBS is still about, though won't handle above 9k6 -
although improved versions are rumoured.

best of luck

>as it's your original statement.

That is not true. I always said a double-clock is used for some internal-parts
of the logic, but the bus-clock is used for IU and FPU (which are the
important parts).

The statement 68040 = DX2 style-clock came either from you or s. o. else. I
don't hold my news that long, so I cannot retrieve them mails.

Jooooooohhhhhn!!!

IX. Summary of special files

X. Summary of system programs

XI. Dependencies between packages

Subject: I. Introduction

Welcome to the "How to Install MiNT and Friends" Draft FAQ. This FAQ is marked as a draft because it is still very young, and may contain numerous mistakes. Please treat the information in this document with caution; do not rely on its accuracy just yet.

This document attempts to explain how to install MiNT, MiNTos, MiNTnet, X and other utilities on a TOS computer system.

Subject: I-A. Assumptions and system requirements

For the purposes of this document, I will assume that you have an Atari ST/STe/Mega/Mega Ste/STacy/Book/TT/Falcon or compatible computer (such as an Eagle or Medusa) running the TOS operating system or some variant thereof.

Since a MiNT system is most useful when it is installed on a hard disk drive, that is the kind of setup I will describe. Sometime in the future, details of setting up MiNT for a floppy based system will hopefully be added to this document.

Subject: I-B. Gradual installation

One of the virtues of MiNT is that, while it changes the operation of your operating system to a very large degree, it is still backward compatible with TOS. That is, TOS programs will run under MiNT. (In fact, not all TOS programs will run under MiNT, but a very large percentage of the well-written ones do.)

This means that you can install the MiNT kernel into your system, and still run ordinary TOS and GEM programs. You can install a complete MiNT system in pieces, as and when you have the time and energy.

Subject: I-C. Conventions used in this document

This document is in a format similar to the UseNet minimal digest format, although it may not be entirely compliant yet.

If you know the answer to something in [square brackets], please mail it to me, so I can put it in the next version of this FAQ.

Things in {curly brackets} are notes to myself, and indicate what might be in later versions of this FAQ (no promises, though!)

Subject: I-D. Where to get the files

To get files off the Internet, you'll probably have to use FTP. If you don't know how to use FTP, ask someone at your site, or read the instructions found at the end of the Atari ST FTP Site List, regularly posted to comp.sys.atari.st [Where else can this be got from?]

One of the most well-known Atari archives is at the University of Michigan, on host atari.archive.umich.edu in the /atari/ directory. I will refer to it as Umich, and give paths relative to /atari/

For those on the eastern side of the pond atari.archive.umich.edu is mirrored by SunSITE Northern Europe on src.doc.ic.ac.uk in the /computing/systems/atari/umich/ directory. Please pull files from there rather than Umich if you're in Europe.

Another well-known Atari site is HENSA/Micros in the UK. Their host-name is micros.hensa.ac.uk and the atari section is in the /micros/atari/ directory.

For example, the MiNT 1.12 binaries archive is on
Umich: Mint/mint112b.zoo
HENSA: mint/a/a050/mint112b.zoo

If you have access to gopher or the World Wide Web, it will be easier to access files that way. You may gopher to gopher.archive.umich.edu or micros.hensa.ac.uk or access the URL http://www.archive.umich.edu/ or http://www.hensa.ac.uk/

Subject: I-E. How can I join the MiNT mailing list?

Jeff Weiner (weiner@terminator.rs.itd.umich.edu) says:

Send mail to mint-request@atari.archive.umich.edu stating that you want to subscribe. It doesn't matter how you word it, as a human being will read it.

In a day or two, you should receive a note that looks something like this:

You're now subscribed to the mint-mailing list. Send administrativa to mint-request@atari.archive.umich.edu and submissions to mint@atari.archive.umich.edu. Submissions go directly to the members of the list and are not subject to moderation. As we'd like to keep it this way, please do not send large binaries or other mail-clogging items without warning us first.

Also note that should mail to your address bounce at any time, you may be removed from the list without warning. If you don't receive mail from the list, please ask us if you've been removed.

If you do not receive such a note, either a) your mail never made it here or b) we're really busy and haven't added you. If you do not receive a reply within a week (we shouldn't be that busy), please try us again.

Questions? Send them to me alone or to mint-request at the above address.

Subject: II. Installing the kernel

Subject: II-A. What is MiNT?

This section is based on a posting by zonny (zonny@xs1.xs4all.nl):

MiNT (MiNT is Not Tos, or, new version, Mint is Now TOS) is a Multitasking system for the ST. Original TOS is non-multitasking, and original GEM has a limited multitasking ability known as 'accessories'. The Atari Official MultiTOS is based on MiNT, still using it together with something like MultiGEM or so.

Using MiNT you can run several programs at the same time, both WORKING. So you can unpack a big .zoo and play a game/read a doc at the same time.

Theoretically, that is. Not very much games, and not all programs are MiNT compatible. You can use Mint to replace normal tos, and just run the desktop (GEM). However, you can't RUN programs at the same time using GEM.

There are several solutions to this. Either use an accessory that runs the programs for you (i.e. Toswin or gemterm) or don't use gem. If you use toswin or gemterm, you can only run one GEM program (the desktop), but several .tos-programs. These don't use the GEM interface, so you don't use gem. If you don't use gem, you should use some other interface. Either a multitasking desktop (but these mostly come with there own multitasker, and are commercial (MiNT isn't)) or a command-shell.

There are many command-shells, most giving a Un*x like system, but you still can't run any gem-programs. Only tos. For instance, I use MiNT and MinixFS (a replacement file system, giving your ST disks the same 'look' as unix) to set up my own net. To atari's linked, and a modem, using MiNTnet and the 'multi-user-setup' from the 'Mint distribution kit'. I can run internet-software, (like lynx, several tcp/ip terminals, etc No graphical www browser, though....:( ) but NO gem. (not with mint, anyway. I can disable mint in the auto-folder, and be running normal gem.)

[When did Eric Smith start writing MiNT? When did Atari start to license it off him?]

Subject: II-B. Installing it

* Before you start, get a copy of the ZOO archiver. You will need to extract several ZOO archives. It is
Umich: Archivers/zoo21.ttp and Archivers/zoo21bin.zoo
HENSA: mint/tools/zoo21.tos

* Next, get the MiNT distribution. You need the file MINT112B.ZOO; this file contains the main MiNT program file. You should probably get MINT112D.ZOO too; it contains the documentation for MiNT.
These files are
Umich: Mint/mint112b.zoo
Umich: Mint/mint112d.zoo
HENSA: mint/a/a050/mint112b.zoo
HENSA: mint/a/a050/mint112d.zoo

* If you wish, unpack MINT112D.ZOO, the documentation archive. Be warned that the documentation in this archive is rather programmer-oriented, and may not be comprehensible if you don't understand how operating systems work. Read and understand README.DOC. The best file to read next is MINT.DOC. You may wish to read some of the other documentation, too. The files in the MAN\ folder are in Unix nroff/troff format; if you don't know what nroff or troff are, you probably won't understand these files.

* Unpack MINT112B.ZOO, the binaries archive. Read README.1ST and README.BIN. Read and understand COPYING.

* Be sure you have an up-to-date backup of your hard disk before you proceed further.

* I suggest installing an AUTO folder boot manager before you install MiNT. The boot manager should be the first thing in your AUTO folder (other than screen and hard disk drivers) and will allow you to choose which AUTO folder programs and desk accessories to load. If you get stuck in a situation where your computer will not boot up, you can use the boot manager to disable suspect programs (such as MiNT) and regain access to your system. I use SuperBoot version 8, and I understand some people swear by

XBoot. [What boot manager do you use? Is it any good?]

* Check the root directory of your boot partition. If there is folder called MINT or MULTITOS, delete it or rename it. If there are any files with the extensions .XDD or .XFS, or a file called MINT.CNF, get rid of them, too. These files and directories are examined by MiNT when it loads, and incorrect files by these names could cause MiNT to fail.

* Now that you're prepared for the worst, copy MINTNP.PRG, which you extracted from MINT112B.ZOO, into the AUTO folder. As a general rule, it should be the last thing in your AUTO folder. However, check in the next subsection, "Known conflicts with other AUTO folder programs", in case there are programs you should disable before attempting to run MiNT.

* Reboot your computer. The computer should start up normally, except that a new message will appear. It should say something like "MiNT is now TOS" and give the date and version number of MiNT. If your computer has a 68030 or better processor, you may also get a message warning you that you have turned off memory protection; this is normal.

* Test your computer to make sure that the majority of your software works properly. Some of it may not be compatible with MiNT; unfortunately, there is nothing which can be done about this, other than getting the program's author to release a MiNT-compatible version.

Question
I'm having problems getting MiNT to run. I heard I need MINTNP.PRG, because I'm running on a 68000 processor.

Answer
Daniel Eriksson (root@icon.pp.se) writes:

MINTNP.PRG is just MINT.PRG but with a different filename. When MiNT starts it will check its own filename and enable or disable memory protection depending the name. This, however, is only true for MMU- equipped systems (f.e. PAK/3, TT and Falcon). On systems without a MMU the filename has no effect and memory protection will always be disabled.

MINTNP (as in "MiNT No Protection") will disable memory protection on MMU-equipped systems making some "ugly" programs that violate memory they don`t own run better (f.e. GEM/AES).

Oliver Sturm (sturm@ost1.ping.de) writes:

But have you checked out, which drivers are in your /mint or /multitos directory?? Some drivers may collide, e.g. the plip and lpdev drivers don't work simultaneously, of course. I'e had a problem similar to yours which was because of a faulty

combination of drivers, but didn't look like it at first,
because none of the programs were able to show any messages
before the crash.

Subject: II-B.1. Known conflicts with other AUTO folder programs

[I don't know of any conflicts... Do you? Let me know!]

Subject: II-B.2. Redundant AUTO folder programs

The following are programs you may have in your AUTO folder; they are
redundant when you use MiNT, as MiNT performs these functions itself:
* POOLFIX3.PRG, POOLFIX4.PRG or POOLFX92.PRG
* FOLDERXXX.PRG, CACHEXXX.PRG [I'm not sure about these. Are they
still necessary?]
* [Any others?]

Subject: II-C. Kernel versions

{68000/68030 versions}

{MH-MiNT}

Subject: II-D. The MINT or MULTITOS folder

When MiNT starts up, it looks for a folder in the root directory of
your boot disk called \MINT\ or \MULTITOS\. If it finds either of
these, it searches there for its configuration file and loadable
device drivers and filesystems.

If you have a MiNT configuration file, it must be called MINT.CNF.
This file is described in the next section.

Loadable device drivers have an extension of .XDD and provide
low-level services to programs. Loadable filesystems have the
extension .XFS and allow transparent access to disks with different
formats than the usual TOS format.

Subject: II-E. The MINT.CNF file

{Complete list of MiNT1.12 MINT.CNF options}

[What options in the MINT.CNF file are the most useful to you?]

Subject: III. Adjusting GEM to work smoothly with MiNT

Subject: III-A. Replacement desktops

{Gemini}

Ben Bell (bjb@bigbox.demon.co.uk) writes:

I have just discovered Thing, which handles long filenames. IMHO it is
better than Gemini in many ways, and as it is an early version I'm
sure it will get even better. I think I got it from HENSA if anyone's
interested.

[What's your favourite MiNT-aware desktop?]

Subject: III-B. Replacement file selectors

Mark Baker (mnb20@hermes.cam.ac.uk) writes:

As for features, it [mfsfm] has the most important ones but it isn't
as nice to use. It's the best one to use for MiNT, as it always forces
you to use drive u: so you can then ignore the drive altogether and
use filenames like /hd/file.txt

Ole Pahl (Ole_Pahl@iz.maus.de) writes:

I think the best one is BoxKite. It looks very similar to Selectric,
but it supports MiNT filenames. You can probably find it on
ftp.uni-muenster.de.

[What other MiNT-aware file selectors are available?]

Subject: III-C. MiNT-aware applications

[Any good TOS/GEM applications which take advantage of MiNT?
Preferably ones which don't depend on the other MiNT packages.]

Subject: IV. Installing MinixFS

Subject: IV-A. What are Minix and MinixFS?

Sometime in the mid 1980's, Andrew Tanenbaum wrote an operating system
for IBM-compatible PC's which he called Minix. It was written to
accompany his book about operating system design, and tried to be
compatible with Unix V7. A version of Minix was released for the
Atari, too.

When MiNT was being written, some people had Minix partitions on their
hard disks which they wanted to access using MiNT, so Stephen Henson
wrote MinixFS, a MiNT loadable filesystem to allow access to Minix

partitions. Many people now use MinixFS with MiNT, despite the fact that most of them have never had Minix. MinixFS has now become the standard unix-like file system to use with MiNT, not least because it is the only one currently available.

Subject: IV-B. Suitable hard disk drivers

I use ICD's The Link, and The Link driver v6.1.4 to access a 150 megabyte MinixFS partition, and have experienced no problems. [Which other drivers work?]

Subject: IV-C. Installing the MinixFS driver

* MinixFS is distributed as a binaries archive, MFS6011B.ZOO, and a sources archive, MFS6011S.ZOO. The documentation is contained in the sources archive, so if you want the docs, you'll have to get the source code too. Obtain the files:
Umich: Mint/Filesystems/mfs6011b.zoo
Umich: Mint/Filesystems/mfs6011s.zoo
HENSA: mint/a/a062/mfs6011b.zoo
HENSA: mint/a/a062/mfs6011s.zoo

* If you decided to download it, unpack MFS6011S.ZOO and read README.1ST and COPYING. There are also several .C source files, which you don't need to refer to. It's probably a good idea to read as many of the files in the DOCS folder as you can take.

* Create a folder called MINT in the root directory of your boot partition. (If you wish, you can call the folder MULTITOS instead, but I will assume that its name is MINT.) At this stage, it may be useful to configure your boot manager to enable and disable files called *.XFS in the \MINT\ folder you've just created. Changing the .XFS extension to .XFX is sufficient to disable a loadable filesystem.

* Unpack MFS6011B.ZOO. There are several programs here, but the file you want right now is MINIX.XFS. This is the loadable filesystem which allows access to Minix format partitions. Copy it into your \MINT\ folder.

Note that MINIXFS.DOC states that you should put MINIX.XFS into your root directory. It is wrong. If you do what it says, MinixFS will not load. MiNT used to search the root directory of the boot partition for *.XFS files, but recent versions only search the \MINT\ and \MULTITOS\ folders.

* Reboot your computer. You chould see an new message stating that MinixFS is installed, and giving the version number.

Your computer can now recognise and access Minix format partitions,
even though you probably haven't got any MinixFS partitions for it to
access yet. Initialising a partition with a Minix file system is the
subject of the next section.

Question
I've installed MinixFS according to the docs, but I can't
access my Minix partition. Why?

Answer
Daniel Eriksson (root@icon.pp.se) wrote:

Have you checked that MinixFS is running?

The problem is that MiNT v1.12 does not search the root. You
will have to place MINIX.XFS either in C:\MINT\ or C:\MULTITOS\
in order to get MiNT to start it up.

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) writes:

The problem is not that mint only searches c:\mint or
c:\multitos, but that in the minixfs installation instructions
it specifically tells you to put minix.xfs in the *root*
directory. This is where the confusion comes from.

Subject: IV-D. Initialising a Minix partition

| I am trying to extract some ZOO archives onto a MinixFS partition, but
| the filenames are truncated to 8.3 format. I have turned all the 8.3

] Why would anyone want to buy an Atari? I do believe that they are
] the best MIDI platform (yes, even better than MAC, DOS, or Windows machines
] I have one running my studio and have produced two albums of original music
]
] But is there any other reason that one would want to put up with
] such a small company?

Hey, finally, a replacement for sinclair!? :)

Ataris are simple to use machines, which take a matter of seconds to boot up, don't need wierd memory configurations, (If it's got 4meg, you can use it all at any time, for anything). They are cheap. It's hard to find an application which doesn't exist for it either PD/SW or commercially. They are the BEST MIDI computers around, as they were created with MIDI pretty much from day 1, so it works properly and is supported by the rest of the system.

In a nutshell, they are quick (for 8Mhz), simple, and cheap computers which do pretty much what most people are likely to want to do with a home computer.

Atari being a small company has little impact on the machine other than their lack of support for it, we've all learned to ignore Atari and try and support 3rd parties, who usually give us better bits anyway.

2534. Free Korg M1/M1R editor (Atari platform) released

Newsgroup: comp.sys.atari.st
Date: 1995-02-19 21:03:00 UTC
From: csstsme@brunel.ac.uk
Message-ID: <3i8bm4$fi0@izar.brunel.ac.uk>
Source record: 171268
Cross-posted to: comp.sys.atari.st,comp.music,rec.music.makers.synth

I've just uploaded my latest program to atari.archive.umich.edu,
/New/eked-m1.zoo (I presume it will migrate to /Music/eked-m1.zoo in due
course.)

EKED-M1 is a Editor/Librarian for the Korg M1/M1R synthesizers
which runs on all Atari 680x0 computers. It's main features are

o Manages up to 10 banks at a time (memory permitting).
o Editor windows for programs, combinations, global data and drum kits.
o Graphic display for envelope shapes.
o Live editing if Korg M1 connected.
o Drag & drop copying of whole banks, programs, combinations,
effects and global data.
o Auditioning of multisound samples if Korg M1 connected.
o Virtual keyboard for live editing on Korg M1R.
o Real time magnifying glass

EKED-M1 comes with full ANSI C source code.

No you can't convert it. But you can plug it into the ST's serial port,
and use it from there. You will need software to allow this to happen,
e.g. the commercial Mouse Tricks from ST club.
But I would agree that it's less hassle and probably less money to get a
3rd party mouse.

>Hehe, to think that my battered old 8 quid Casio fx82b can do division better
>than
>a 2000 pound Pentium. Pffahaar ! Someone pass me a glass of water :p

Very true, but the people with not quite so much money stick with an
AMD486, and that does not have crappy division problems.
And it is true that the PC beats the ST in everyway, it just depends on
what parts you bolt onto it. An AWE soundcard will piss over the ST/E
sound output, but you do pay for the privilage (200quid! > than an ST!)
Basically, you get better than ST performance, but at a (very) high price.

>|> people still insist the machine is very much alive. Atari just don't know
>|> how to
>
>Why ? 'cos it does what they want it to, without the need for crappy programs
>that
>eat up 8 or more megs of RAM, chuckle chuckle :p :)

But 8Megs is standard on a PC these days, and they do run faster than an
ST equivalent. (Well you'd bloody hope so anyway). ST programs don't need
xxx megs RAM or Harddisk, because the user base has on average 1 Meg RAM,
and no harddisk.

Basically, for the ST to succeed, Atari need to make a good, decently
priced, ST compatible 68040 computer, which people will hear about. The
Falcon was not the solution, nor the TT. They PowerPC seems like a good
move... Where's Atari's version?
I think Atari lack marketing of any kind, and are relying too much on
income from patents on 9 pin joystick ports :-)

Take a 520ST (with the ability to drive a TV screen), add 500M
of memory, a DSDD floppy drive (now we're up to a 1040 with extra
functionality), tack on a monochrome monitor, a color monitor, the switch
box to make deciding between the two easy, 80M of hard disk, 2 track
balls (XLNT for Llamatron!), joystick, Magic Sack, *tons* of software
(games, programming and shell environments), pictures, sounds, and other
stuff I don't remember right off hand, and you've got an excellent start-up
or expansion system. Need spare parts? Much of this stuff came from a
1040ST with motherboard problems (the 520ST SSDD floppy is still good),
so there's all that too. There is enough stuff here to keep you busy for
months,

*** all for the low low price of only $520 US!! ***
(not including shipping and handling)

I'm in the S.F. Bay area, so if you can work something out to pick up
the system, then there's no shipping to add (otherwise, we'll work something
out).

If $520 sounds like too much, let me know how much you're willing to
pay, and maybe we can work something out. Send all offers to
deej@cadence.com.

Message-ID: <5S27Ea0.jongleur@delphi.com>
Source record: 171235

On 25 October 1994, I sent a money order for $50.00 to Michael Baffoni, the North America contact for CoNnect registrations. It is now four months later. I have received neither key, nor reply, nor a return of my money order.

If either Michael Baffoni or Wolfgang Wander, the author, have any idea what has happened, please let me know. For the record, I am not here accusing (or even suspecting) anyone of shady dealings, but am rather hoping to hear there was a mixup and that my key and manual will be on their way to me soon.

I've been putting this inquiry off for several months, as I have no e-mail address for either Michael or Wolfgang. However, I'm getting a bit tired of reinstalling and reinstalling and reinstalling this GREAT program, and after four months, feel that this is more than a simple case of snail-mail delay.

Thanks.

Just wondering, what this file in pub/atari/incoming on ftp.uni-kl.de
is:

Feb 9 09:08 Zip File STARWARS.ZIP 1379Kb

As you can see, it's not a small file, and somewhat larger than I'd
be willing to download, only to find it's a demo for the Falcon! :)

On that note, here's my highly sceptical listing of the laws of FTPing

Steves laws of FTPing:

If a file sounds useful, it will be one or more of the following, which you
find out only after downloading it:

Crippleware
Extremely expensive shareware
In a foreign language
Runs in a resolution your monitor/computer can't handle
A corrupted archive
Needs a newer processor than whatever your machine has
Be a re-uploaded version of a program you got 3 years ago
Archived with something you haven't got
Require more memory than you have
Require more drive-space than you have
Need a certain program or device you don't have
Be an upgrade to a program you have no use for
De-archive to a file 1k larger than the disk you are extracting it to.
Ask you to insert disk #2 when only the first disk was available

Anyone got any more? I've come across all these at some stage! ;-)

Source record: 171244

Yes, you can directly connect from the serial port of an ST to the serial port of a PC... but...

You need to use what's known as a "null modem" cable or adapter.

What this does is to reverse two of the signals so the sending end of one computer talks to the listening end of the other, and vice versa.

Null modem cables or adapters should be easily available at any computer store or "Radio Shack" type store.

Then you'd use your regular telecom programs to upload and download the files between the two computers...

>Is there a *graphic* web browser available for the Atari St computers
>available? Something like Mosaic for Mac/Pc/Unix...

Not yet, but reportedly there are some in development. Although, if you
get the X port to the ST running, as well as a proper SLIP connection
(see below), you should be able to run Mosaic on your UNIX host and set
the display to your ST. Of course, this also assumes you have Mosaic on
your Unix host. :)

>
>I have tried out a program for a PC which fools the UNIX host to think it's
>a SLIP account that's being used. It's called "Winsocket" or something,
>and there's TIA (The Internet Adaptor) available as well.
>We have TIA installed on the UNIX system I'm connected to (modem connection)
>so, can I use this with my STE? How?

I have been looking into TIA and you definitely should be able to use it
with your STe. What you need is some SLIP software for your STe, such as
MintNet or Ka9q-NOS. If you want to run MintNet, you need Mint. What TIA
will allow you to do is run a program on your Unix host which starts the
SLIP connection and then you need to setup the connection on your ST as
well with the proper commands. How to do this is best explained by reading
the docs for the appropriate packages. I haven't yet got it to work myself
but I'm getting there. :)

You can get lots of information about TIA from :
http://marketplace.com

and pretty much all the info I mentioned above is contained within some good
FAQs I found at:
http://www.dl.ac.uk/MISC/ATARI/atari.html

>ADSCSI. :-)

Hi Danny, there is a intesting file on uni-kl.de CHIPS175.TOS it has some info
regarding adding Parity to Host Adapters...

But the Big problem is its in German...

The ELS Quantum Drives can have thier Parity turned off, but you must have
a version of Rom to do that....

ICD INFO FROM ICD...

Quantum ELS with The Link: Problem and Solutions for drives made in 1992.

The following information is for owners of "The Link", a SCSI host adapter
for Atari ST computers, and Quantum ELS series hard drives with firmware
older than version 4.05. ELS drives with the newer firmware have not been
shipped by Quantum as of this writing and probably won't be until sometime
in 1993. Firmware version 4.05 or higher is required to disable parity on
an ELS drive. Parity is not supported with The Link. Unfortunately a TT,
a Falcon, or an ICD host adapter which does support parity is also required
in order to disable it so be sure to have one of these available. The
following ICD host adapters do support parity: Advantage ST, Advantage
Plus ST, AdSCSI ST, AdSCSI Plus ST. The other models do not.

Included with this file are a special version of BOOTFIX.TOS from ICD and
two other files from Quantum which will allow those with the knowledge and
proper equipment to make their own 4.05 ROMs. ELS_S405.HEX is the 4.05
firmware code in Intel Hex format. ELS_S405.BIN is a binary image of the
firmware ROM (binary format). These should have a checksum of $2E00 and be
programmed in to 27C512 32 pin PLCC EPROMs or OTP EPROMs. Quantum has used

Atmel AT27C512R-15JC OTP EPROMs so 150ns is probably more than sufficient.

An alternative is to call Quantum, explain that you need parity disabled on your ELS drive, and tell them that you need new firmware of version 4.05 or greater to support this. In the USA you can call 900-740-4433 to request new ROMs. Warning! You will be automatically charged for this call and I am not sure of the rate. If you are "blocked" from 900 numbers, try 408-944-0410.

Once you have the new ROM, carefully replace the old ROM, which is the only IC in a socket on the ELS drive PCB. Then connect the drive to a SCSI port which does support parity, boot the computer and run the new BOOTFIX.TOS. After that, the drive will permanently have parity disabled and work with The Link. Our hopes are that dealers or distributors will offer this service to their customers since they will have better access to the required equipment.

Thanks for supporting our products and good luck!

Hop this helps Danny....

: the LJ or DJ driver.

: Obviously, that's the black page syndrome. Does anybody know how to
: solve the problem?

: Configuration: Mega ST2, 2MB, Speedo GDOS, Works 1.20x, HPLJ III

The black page syndrome is caused by a combination of a bug in a particular version of Works and too little free memory. The fix is to go back to a previous version. A work-around is to free up as much memory as possible by not loading unnesesary auto-folder programs and accesories when trying to print. I'm not sure of the version numbers but I believe 1.2 is the one with the problem.

with all ST's if you make a suitable cable."

Unless the cable also included a power supply, I doubt it would work very well. <grin>

Seriously, I don't think enough power is available off the ST's monitor port to power the circuitry of the A520 (the Amiga modulator).

However, provided he cannot find a decent priced on a used Video Key, your solution has merit, provided the power issue is taken into account. One clean solution would be tap into the ST's internal power supply, and then route the signals to two unused pins on the monitor port (after detaching the signals currently attached). Even if both 12 & 5 volts were needed, there are two pins most folks likely never use: #3 (General Purpose Output), and #5 (Audio In).

2561. Re: Monitor port on ST....

Newsgroup: comp.sys.atari.st
Date: 1995-02-20 08:00:13 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JC65s9F.lmcclure@delphi.com>
Source record: 171206

In a message dated 2-17-95, Rob Stark said:

"I can get an I.C. from Maplins that will extract composite
sync from the composite video output, but it costs about 5
quid, and 'cause I'm a tight git, I'm trying other ways first!"

Here's a cheap solution that has been used successfully in the past:
Put a 330 ohm resistor on each of the two sync lines, and tie them
together at the point past both resistors. (Imagine a "Y"). The
resulting single line will work as composite sync for most monitors.

2562. FAQ: GDOS 2.4

1 Technical Info

My email address will change. Due to this reason I
have an alias, pointing to my actual location - and if it's in the
MAUS-Net: G.Castan@physik.uni-stuttgart.de

For easy location of this document at servers and mailboxes, I ask for
using the following name(s) and saving the ascii AND TeX versions:
FILENAME = gdosi24 (German version)
FILENAME = gdosi24e (English version)
CR+LF should be used when saving at UNIX-Fileservers too, not just LF

2 Introduction

Actually I'm writing a program, that makes his print-out via GDOS. Looking
for printer drivers I faced the problem, that many times no documentation is
included to the drivers.

Otherwise it may happen that there are different drivers with the same name.
But what are their differences?

Here I have briefly collected my experiences with printer drivers.

This collection doesn't generally want to describe coders how to use printer drivers (except to problems not mentioned in literature). And you wont find information about the concept or how to install printer drivers. To get this refer to the list at the end of this FAQ.

What I want to exclaim here is more information about the several drivers:

o Where are the drivers available?
o How to distinguish them?
o What are the problem with them?
o Which drivers can be used for certain printers?

If anybody has more experience or questions, please write me. I will face the work to update this FAQ.

Gerd Castan.

3 Motivation

With GDOS it took me ~2 hours of coding, to get the screen-output to the printer in maximum quality. And (almost) with no extra work I get output to printers I even don't know.

I there's anybody who wants to write a program with printing options, should better care of the main job of the programm.

Nobody wants to pay for printer drivers if there's another program that didn't take the coder extra work with such stuff making this program less expensive (and surely better).

The user has - besides the lower price - another advantage. If he uses several programs he need place for the driver and the fonts only one time on the disc.

SpeedoGDOS is available from Atari shops (Atari Competence Center in Germany) now.

The (qualified) feedback to my FAQ has - compared to autumn '92 - raised remarkable. Due to Speedo the interest in GDOS coming from the coders seems to be bigger.

4 Changes

Now (from 2.4) I'll switch back to listing the changes here, not in the table of contents ...
Anyway, a "*" stand for changed chapter and "+/-" for new or removed chapter (I guess you'll know which char stands for what <g>)

One Important thing to note: The dates of the GDOS drivers are in German format, that is: DD.MM.YY! Remember that! (But I guess you alreade noticed that?)

MT90	21.12.90	44881	BELA			180dpi	SP
PAINTJET	27.01.92	60005	FontGDOS		n		SP, OTL
PAINTJET	?	60173					SP
PAINTJET	28.01.93	61648	SGDOS 4.0		n		SP, SPD
PAINTJET	02.07.93	63642	SGDOS 4.2		n		SP,SPD,TT,T1
PAINTJET	14.08.92	60173	I				SP, OTL
_PAINTJET__	13.10.91_	_45934_	_WT_____	___	___	_____	SP_____

Note: The drivers named HP_LJET and DESKJET can be used for (HP compatible) ink and laser printers. The difference is in the transfer to the printer: Packed (p.) or not packed (n.p.). 'Delta' means that the data is delta packed.

PAINTJET:
180X180: 2-8 colo(u)rs
90x90: 16 colo(u)rs

MT90 is made by Patrick Dubbrow.

Using ink drivers produces a problem with bitmap fonts. Using 300dpi all is ok. But 360dpi fonts are optimised for best efforts with pin printers having thick pins. Using ink printers makes the fonts look much too thin.

Solution: either use 300 [600, 1200 :-)] or exclusively use vector fonts

5.2 9pin drivers

_SLM_HS____	17.01.94_	_63663_	_ROM_____	___	_n_	_____	LS,_SPD_____

SLM_HS is a SLM driver for the Falcon (when using the Heatseeker interface)

5.6 Screen drivers

The screen is (if VDI functions are used) seen as an output device just like printer, plotter etc. That's why fonts for the screen can be installed in ASSIGN.SYS just like for printers.

Normally this isn't remarked because the drivers are in ROM. But they can be used like printer drivers.

Note: For system fonts only (like the original ones) non proportional fonts with a 8*8 or 8*16 matrix can be used. That's limited by the AES not VDI.

With newer AES (from 4.0?) it's no problem to use fonts of free choice (Variable AE_FONTID and AE_FONTSIZE in GEM.CNF, see [19]). Coders should make sure their programs can take that. (even like scrollbars of free width)

Bitmap fonts not assigned for screen driver 1 are not available for other screen drivers.

5.6.1 LineA

The so-called LineA-routines are subprograms of the screen drivers from the ST series, to bee seen undocumented. This is the hardware depending part of these drivers.

The attentive readers discovers it: Exchanging the drivers removes the LinaA routines too. As happened with the TT for example.

So never use them!

/Reading/ acces can be taken to the LinaA-variables. But Why?

5.6.2 Setscreen & Getscreen

These XBIOS-Functions (mostly Setscreen) should'nt be used.

But what am I talking. For those useing them or those being tortured because someone did it:

The video hardware of 1040STE and Mega STE has an hardware bug. When defining a new physbase with Setscreen (and if it's the same gotten with Getscreen), it may happen that the screen is 'folded'. This happens due to the movement of a register at a special moment, which is only allowed to be moved at special phases of the screen output.

What has to be done?

Users: The programs NVDI and FALT_OFF stop this error. Or give this FAQ to coder.

Coders: Either even don't use Setscreen.
If You use it though: If physbase isn't changed, the value taken with Getscreen may not be used. Use the value -1 than physbase!

5.6.3 NVDI and WARP 9

There are two often used programs exchanging the ROM drivers: NVDI and WARP 9 (earlier QuickST). TurboST was distributed by BELA but isn't updated no more.

If these are used once, one will never want to miss them: the Desktop seems to be terribly slow. I will never want to work without NVDI on my Atari. Others say the same about WARP 9.

NVDI uses strongly optimised drivers for the ST and TT resolutions. Sadly I don't know which drivers are used by WARP 9.

NVDI is available from Behne & Behne and contains not only the drivers but a GDOS and a manual describing exactly all VDI calls.

WARP 9 is available from CodeHead.

Due to this NVDI is spread in Germany and WARP 9 in the US

Different to NVDI WARP 9 only speeds up the text output. Grafics stay slow as before. AND the newest version doesn't work with MultiTOS. It Works on the Falcon too, but I don't know if it supports *all* resolutions there (Like with Screenblaster, BlowUp030 or others)

5.7 Other drivers

IMG-0300			Reschke,wt	n			LS

IMG-0300 can be copied (non commercial). The other IMG-0??? drivers are by SciLab. ZEBRA is for the Zebra Labelprinter.

5.7.1 Memory drivers

A memory driver doesn't do anything else than a screen driver (see [17] and [15]). But the output doesn't get to the screen driver, but in another memory to be influenced there.

The usual v_openwk binding doesn't have all parameters needed to open this driver. If not included to the language this binding must be made by yourself. A listing is found at [17].

The memory driver listed above is only capable of b/w output only and has a logical resolution of 300dpi. The (matrix) drivers tested by me have no problems with fonts installed that are for other other drivers. The memory driver should take screen fonts - due to the 300dpi.

Problem could appear because of the aspect ratio (relation of pixel width to height) - normally not similar to the screen resolution.
Due to this circles can be displayed as ellipses.

With NVDI V2.5 or higher output can be made to offscreen bitmaps. There can be made any GDOS outputs and the result can be copied in the screen windows.

5.7.2 Plotter drivers

A HPGL driver seems to be distributed with the program DATA. On PD disk ST 458 (German PD series) is one too. If I get more about it I'll include this info here.

5.7.3 NVDI 3 drivers

NVDI 3 has its own driver concept. Only a small quantity of drivers is included, but they're very fast, small and flexible.

The drivers are:

```
_____________________________
|_Treiber______|_Datum____|
| PINPRN.SYS | 19.10.94 |
| PAGEPRN.SYS | 19.10.94 |
| IMG.SYS | 30.10.94 |
| MEMORY.SYS | 18.10.94 |
| META.SYS | 18.10.94 |
|_ATARILS.SYS__|_18.10.94_|
```

Depending to the colo(u)r printing capability of a printer (this can be set in the MAKEPRN.APP), the drivers have to use different offscreen drivers to create the graphics (this can't be found in the manual coming with NVDI 3
[Stef: A manual like for NVDI 2.x is in work]
Gerd: It will be an ascii file for FTP servers and BBS, not a printed one)

The Offscreen drivers are:

```
___________________________________
|_Treiber_______|_Datum____|Farben__|
| OFF002.NOD | 06.11.94 | 2 |
| OFF004IP.NOD | 06.11.94 | 4 |
| OFF016IP.NOD | 06.11.94 | 16 |
| OFF256IP.NOD | 06.11.94 | 256 |
|_OFF32KFL.NOD__|_06.11.94_|_32768__|
```

The actual NVDI 3.01 can't handle colo(u)r printing though :-(
3.02 will. (Which is soon to be released. More then ...)

The flexibility to create a driver's INF for printers is great. To code a driver for SpeedoGDOS you have to become a developer for SpeedoGDOS.
It isn't that easy ...
With NVDI you only have to enter you printer's codes in MAKEPRN.APP. So you only have to check you printer's manual, not learn or do C coding.

The codes driving the printer are saved in the INF files belonging to each driver. A flaw is that these assignments aren't simply exchangeable. There's no documentation about the file format and no program to extract or add codes yet. The only way is to exchange the complete INF file.

Another problem not even noted in the manual occurs when assigning pixel fonts in the ASSIGN.SYS. Guess that you have assigned 180dpi fonts to the PINPRN.SYS. It's easy to change the output resolution to 360dpi by the CPX. *Then* the printout will be catastrofugly.

A workaround is to duplicate the driver with another name (close to the first ...) and assign this one to in the ASSIGN.SYS too, but with different fonts.

At last I think those drivers conceptionally are much better compared to the ones coming with SpeedoGDOS 5. No colour printing yet though.

5.8 What's missing

I don't know drivers using the abilities of the following printers:

o Canon BJC 600 - A colour printer with 4 heads (CMYK) 64 nozzles each.
In the colour mode he's compatible to:
- Canon BJC 800
- Epson LQ 2550/2500
It's resolution is 360x360. I dont's know any GDOS driver supporting the BJC's capabilities directly (or via compatibility mode) when using colours.

6 Errors

Errors in the printers drivers - that I know - are the following:

1 These drivers display Fonts with the attribute 'light'
2 Doesn't work on TT
3 The EXTENDED ENQUIRE FUNCTION (VDI 102, vq_extnd) doesn't give back the parameters as listed in the German 'Profibuch' (Jankowski, Rabich, Reschke - Sybex)
4 Using the attributes 'italic' and 'outlined' the letters of bitmap fonts are cut off on the right side. This error appears independent from other attributes being used.
This error was in the Libraries of the driver sources from Atari and seems to be included in all drivers except to NVDI and SpeedoGDOS.

If theres nothing written about an error I don't know if this error appears or not.

Seems it's no accident, that Xact only uses the attributes 'fat', 'italic' and 'underlined'. (See [5])

Another reason against using 'outlined' is the following:
If You make a driver calculate an outlined font from a normal one it get's 'wider' by two pixels. Due to the reason that a pixel has a width depending to the resolution (other than a fitted font) a text gets different widthes in each resolution. But who wants to have different textformat on

different printers? The only way to stop this is letterspacing -
typographic 'bullshit'.

7 Fonts

First: What's the difference between a fonts and a face?

When calling a font selector there may be Swiss 721, Swiss 721 italic,
Swiss 721 Bold and Swiss 721 Bold Italic. These are 4 faces, alltogether
creating a font.

This separation isn't that simple at bitmap fonts, because all attributes are
created from only one file (this can be made with vector fonts too, but it's
quite nonsens In my opinion). That's why I first didn't note that this
attribute creation is buggy in some versions of SpeedoGDOS (see 13.3.3).

Me I'm not always using this separation of font and face in this FAQ.
Especially in the chapter about font formats.

7.1 Bitmap fonts

The fonts used are bitmap fonts in the DR standard format. They have to be
saved in Intel format. Motorola format isn't supported by any GDOS.
(See [1] and appendix)

GDOS bitmap fonts have their width information defined in both, screen font
and printer fonts. Sadly the designers were a bit too zealous and fitted the
width of the sreen fonts to make them look very beautiful. They've done a
good job, but they're not similar to the printer fonts and don't allow
WYSIWYG.

There are many fonts on the Internet only for the screen and maybe useable
for one printer. Everybody using these fonts should know that he can't print
documents in an acceptable quality via GDOS.

But in the Atari and former BELA package there are included fonts for
all printer drivers in this package (the 360*360dpi fonts are missing in the
Atari package). If you have a useable program you can print every document
with every driver.

7.2 Vector fonts

Vector fonts don't use pixels, they are created with algorithms - supported
by shapes and hints. These algorithms (see METAFONT for a good example) make
the fonts copyrighted like normal programs. (See [23] for this)

Here I'll write a bit about vector formats. Why should a pure user try to
understand it? Nowaydays you'll just get a cheap Font CD, choose 17 of the
most interesting fonts for your first poster an print out the creation.

Problems are: I have one face in different formats. Which one should I
take? Sometimes I have problems on screen, when I print out something or
only when using a specific size. So what?

(When you have 17 Garamond styles from 17 different distributors it's
better to read a magazine about typography or DTP to get help)

7.2.1 FSM-GDOS fonts

The vector fonts with the old FSM-GDOS format by QMS/Imagen Corp. are
named with OTL.

These fonts and drivers should'nt be used no more and are listed to only for
completion of this FAQ.

7.2.2 Bitstream Speedo onts

The vector fonts in SpeedoGDOS format are named with SPD.

They are supported by all SpeedoGDOS releases and by NVDI 3.0 or higher.

7.2.3 Type 1 fonts

Type 1 fonts are available for MacIntosh abd MS-DOS/Windows. They only have
differences in the internal representation, not in the information.

At least one of these formats is supported by SpeedoGDOS from V5.0a. But I
already found some that SpeedoGDOS 5.0a can't display.

7.2.4 TrueType fonts

This format is available for MacIntosh and MS-DOS/Windows too.

SpeedoGDOS from V5.0a and NVDI from version 3.0 can handle both, no
matter if it's for MacIntosh or MS-DOS/Windows. The MS-DOS format
is a superset of the MacIntosh format.

By Apple's definition it's got different tables (like the chunks known from
the IFF format). In the table's header a name and a length is noted. This
way a program can ignore tables it can't handle. When new types of tables
are defined, they have to be announced to Apple. Required and optional
Tables are defined by Apple too. Microsoft used this procedure to announce
new tables and make them obligational for Windows.

The difference between the Apple and Microsoft format simply is that
Microsoft declared more tables as obligational. Plus the fixed order of
glyphs when special flags are set. A definition of the Microsoft format is
found in [28]

I don't know any official documentation which tables are used or required
by SpeedoGDOS 5.0 ff or NVDI 3.0 ff.

On Macs .suit is the suffix for TrueType files. The data is found in the
resource fork.

7.2.5 Calamus fonts

Can YOU tell me more about these?

7.3 Comparison of vector formats

(This chapter is to be completed yet)

There's no noncommercial program on any platform that can convert one format into the other. A lot of fonts are only available in one format.

But what makes a conversion so difficult? To ask different: Which informations are stored by which way?

7.3.1 Curves

First the shape of the chars should be saved. But that for many ways are used (see [25]):
Type 1: Uses cubic Bezier curves aka cubic B-splines
TrueType: Uses square Bezier curves aka square B-splines
Speedo: Uses cubic Bezier curves aka cubic B-splines

For an application there should be no difference between different font formats. Therefore SpeedoGDOS transforms TrueType characters into cubic bezier curves for v_getoutline. I'd like to get (optional) quadratic bezier curves in this case and v_bez_fill should be able to cope with it.

Square B-splines are much faster than cubic Bezier curves but you have to store about 4 times as much points to achieve the same quality.

7.3.2 Hints, instructions, switches

The next problem is the display on media with low resolution. For a neutral observer Speedo fonts always look quite good on the screen (well, some fonts are ugly by nature).

But I've found TrueType fonts that look as ugly as nothing else on the screen. For example the two vertical lines of an 'n' are not the same, one is 1 pixel and the other is 2 pixels thick.

The way to prevent those errors are hints. This method is used by Speedo, Type 1 and TrueType (but not by Type 3 and CFN). But hints given by the format don't mean that they're used too!

So, finally: All these three font types can look very good on the screen, Type 3 and CFN can't [ever tried to print CFNs on a printer with less than 360x360dpi?]

Now I've noted, what hints are doing and in which formats they're used. But *how* do they work? Specific parts of a character have a specific >>job<<, like serif, bow etc. This is saved besides the font's outline. This way the scaler e.g. can create similar vertical lines of a >n<. More is found in [25]

Type 1 only can handle very few different hints compared to other formats.

Note:
with v_getoutline you get the outlines in the workstation's actual resolution. Remember that using hints depend of the resolution. Plans exist to make v_getoutline independent from the actual hint size.

7.3.3 Internal resolution

After the problem with low resolution now there's the problem with the high resolution. Even if you think there shouldn't be any; there are! (See [26] too)

To display a vector font first an internal system of coordinates has to be selected. To do this the em-square is devided in units. CFN has one from 0 to 16000, Type 1 (which was created when there were no high-res printers) one from 0 to thousand. Due to this there are 'corners' visible at large letters or high resolutions (in the professional league)

Referring to [25] the internal resolution can be raised by the DIV operator. But this has to be supported by the font editor. (Is this done regularly and does the scaler get remarkably slower by this?

CFN can make the big deal here.

With TrueType, the font designer can choose a resolution up to 16768. Resolutions equal to 2^k are faster than others.

7.3.4 Linear and optical scaling

Do we now have - with the description of the shape, a high internal resolution and the hints - a scalable font? Sure not!

A font being designed for 16pt has a totally different shape as a doubled 8pt fonts (see Knuth: The METAFONT book; Kopka: LaTeX etc.). A well designed font isn't linear scalable.

In large fonts vertical lines are much thicker than the empty space between them. But this information for optical scaling can be saved in a font too.

So a font, being 20 pixels high on the screen (this is usually a large font) should look different to one being 20 pixels high on a laser printer (this is a small font that should have small vertical lines).

The rest of this subsection was misunderstood by to many people. Anyway I seem to be the only one thinking here's a problem. That may have (at least) three causes:

o I can't make you understand what I think
o I'm a crazy mind
o the problem's too complicated to make anyone even *see* a problem here

Well, let me (Stef: and me) start anew:

Vector formats make it possible for the font designer to decide a face may look different in points or pixels below a specific size. For example it's useful to make a face broader when used with a small size [25] - independent from the printer's output quality.

So, let's display a small text in a window (e.g. with a size of 8pt). And the font designer made this face look broader at 8pt or smaller.

Another window is used as a magnifier to get a doubled size (Almost any
Word processor has this function - Stef: really?)

This doubled view in the magnifier's window *should* be broader like the
8pt text, the WP's coder shouldn't have to take care about that.

But the coder has to use a size of 16pt in the magnifier's window - and now
the designer's decision (to make the face look broader from 8pt) is
ignored!

To solve this problem there are two ways:

1. The coder sets two values for the size.
- The linear size (16pt here)
- The optical size
But the font engine and the bindings have to be fixed to that.
(it's my recommendation, no reality)
2. Maybe NVDI 3.0 makes it possible to (explicitely) change a virtual
workstation's logical pixel size (Well know more about it from the
docs - recently released by the Behnes).
Then the problem simply could be solved by using another virtual
workstation for the magnifier's window, which will get a pixel size
with factor 0.5.
Now both windows display a text with 8pt and both faces are broader -
like the font designer's thoughts - and the text in the mag's window
has the double size though.

Did anyone get it? (Stef: Yeah, I'd like to get feedback too!)

7.3.5 Multiple Master (MM) fonts

ATM 3.01 (Adobe Type Manager) for Windows now is capable of scaling MM
fonts. With this technology not only height, size, skew angle and rotation
can be set for output, there's one more continuosly parameter. This is to
set, what thick a face is to be displayed. This is no simple algorithm -
like others at GDOS - but the font designer can make sure where to change a
face when it's more or less fat.

This subsection only is FYI. SpeedoGDOS 5.0 only can handle normal Type 1
fonts - and NVDI none.

When taking a look at [29] (about the URW PrintWorks CD), it's visible that
URW has such technology - internally - too. The extremely interesting book
[25] is by URW too.

7.4 Font Format convertition

From what I wrote above I hope you'll realize that converting a font from
one format to another is about as easy as converting a highly optimized
program from one language to another ...

Problems:

o The only converting program I (Stefan) know for Atari
is TypetoType fby Hasso Baudis, converting Type1 to CFN

o There isn't any program on any platform that is accepted by the
comp.fonts community (according to the comp.fonts FAQ)
o For a program capable of converting fonts you'll pay a big
amount of money. But even good programs need manual corrections.
Looking for a PD or shareware program won't be
successfull ...

8 Printers

8 Printer

Producer	Printer	Drivers Fitting
NEC	P6+,P7+, NECP...	
	P60,P70	NB15_(FX...,NX1000)
HP	LaserJet_II	HP_LJET
HP	DeskJet,_LaserJet_III,IV	DESKJET_(HP_LJET)
CANON	BJ10E	BJ10
CANON	LBP_4/8	CANONLBP,_LBP
Mannesmann-Tally	MT_90	MT90
Epson	Stylus_800	STYLUS

Drivers in parantheses work but don't use the ability of the printer totally.
This means - for 24pin printers - that these are used in 9pin mode. At
HP compatible Laser and Ink printers this means that the data isn't packed
though being supported by the printers.

Some Deskjet drivers are told to make problems. In this case try the Laser-
jet driver. The printing takes longer then (due to more data) but the
problems should be removed then.

The BJ10 drivers use the Proprinter emulation. Don't use them in the epson
mode!

The Stylus shouldn't be used with 24needle drivers. The needles overlap
(the ink dots of the stylus don't) and so the drivers just don't print some
dots.

The meaning of compatible normally is made by the producers of the
compatible printers.

Notes:

o If You don't find your printer in the list and knows a fitting driver,
please write me a note.
o Try other drivers even if you have found one fitting to your printer.
o Of course the FontGDOS drivers have a lot of problems with the memory.
But the speed of'em is faster than the other (Speedo not considered).

9 Programs

Nowadays it's obvious (but not usual) to use GDOS in every program.

The following list is limited to those using GDOS to print too.

```
_____________________________________________________________________________
Kind of Program______|Program_____________|Distributor_____________________|Sp|
Chart/Measureanalysis|Xact |SciLab |y |

This list is no commercial. I'll include every program I get to know.
(Comment by the Translator: Sorry for mentioning Atari Works three times,
but I wanted to keep the 'Text/DTP' and 'Spreadsheet' Chapters')

Notes:

o Programs listed in the Speedo column with 'y*' support Speedo but don't
use it - don't output text too.
o Xact can print Speedo fonts without Speedo too.
o FSM-GDOS is included in the Wordflair II package.
o Platon only outputs metafiles via GDOS.
o I didn't make it to print via GDOS in OPUS.
(I've been told, OPUS doesn't chose the fonts it can handle with,
and doesn't print if even one of these fonts is installed. See 7.1 too)
o Programs only printing via device 21 (like OPUS and CLA are out! (see
16.2 too)
o 7up only uses non proportional fonts (e.g. Monospace 821 from Speedo)
o Tempus Word only supports Speedo Fonts but prints with its own drivers
This seems to be due to the capablity of handling CFN and its own fonts
o That's Write & 1st WordPlus 4 both can use Speedo fonts without
Speedo. TW 4 will be able to use TTF and Type 1 without SpeedoGDOS
(well, TW and the SpeedoGDOS 5.x font extension to TTF and Type 1
is created by the same coders ...)
o LDW-PowerCalc: MAXON lost the purchaser database. Ask COMPO for updates
(Stef: hmm, it seems to be a German-only problem?)
o Tarkus is a label printing program.

Kandinsky Version 1.73
ftp://ftp.cs.tu-berlin.de pub/atari/Graphic/kand173
(Version 1.74 is the actual one, though, note by Stefan;
Gerd: but not on any FTP-Server)

10 Utilities

10.1 fontfix

Problem: The font height is included wrong at some fonts. fontfix discovers this error and corrights it.

In the Internet fontfix can be found here:

ftp.uni-muenster.de /pub/atari/Applications/Dtp/Fonts/Gdos

ftp.cs.tu-berlin.de /pub/atari/utils

10.2 Outline fonts

Outline Fonts Accessory by CJG

What for: This utility edits the EXTEND.SYS for SpeedoGDOS. This file contains a description of the volume from the Speedo caches, the fonts and the font-sizes. The caches can be saved to disc and loaded again from there too.
A good done program except to the preset cache sizes fitted to FSM-GDOS not Speedo.

Filename: OUTLINE.PRG alias OUTLINE.ACC, 67644 Bytes (49254Bytes at Speedo 5)

Spread with SpeedoGDOS.

(Why doesn't Atari make it to make programs including a display of the version?)

10.3 Printer drivers

GDOS Devices Accessory by CJG

What for: To edit the ASSIGN.SYS

Filename: DRIVERS.PRG alias DRIVERS.ACC, 64878 Bytes (41592Bytes with Speedo 5)

Before starting this program it's better to create a backup of the ASSIGN.SYS!
The (at least) two reasons are the following:

1. The informations about the bitmap fonts are removed without comment.
2. ASSIGN.SYS is removed by a new one if 'Benutzereigen'-'Hinzufuegen' (in the German release) is selected wihtout any chance to get it back.
(The English Version should have a Dialog like 'Own drivers' 'Add' or similar). To all coders: Don't copy that style!

If this utility should display no drivers sometimes simply start ASSIGN.PRG (see next subsection)

DRIVERS.PRG/ACC only displays the Speedo drivers of my collection. Does anybody know, how it does this? Even it doesn't display the Filename but a name being included as string in the driver. How does one get there?

10.4 ASSIGN

ASSIGN 1.0d is by Dirk Sabiwalsky (PD).

It tests three things:

o Are there several fonts using the same ID and have different Names
(Typefaces)?
o Are there several fonts using the same ID and the same Pixelheight?
o Are there several fonts with the same name (Typeface) and different
IDs?

10.5 FONTCHK

FONTCHK tests GDOS fonts if they have possible errors.

It's spread with ProList for example.

10.6 FONTCNV

Converts GDOS fonts from Motorola to Intel format.

Comes with ProList too.

10.7 GEMFont

Fonteditor being able to read Signum- and PK (TeX)- Fonts too.

Internet: ftp.tu-clausthal.de:pub/atari/systools/gdos/gemfo120.lzh
Use the chance to get a new unlzh or lhxarc.

10.8 FontMonger

Converter and editor for different vector formats including Speedo. Only
works on IBMs or MAC though.

10.9 Font-ID

Font-ID is a little freeware tool made by Frank Schneider. In a window it
displays the fonts installed with GDOS or SpeedoGDOS including the Font-ID
in different sizes. So you can get an overview when you don't have a program
with font selector/ID display function at the moment.

10.10 X4U

Speedo fonts have much more glyphs than the ones displayed in the ASCII
charset. With this program by Peter Hellinger you can setup, which char is
to be used at which ASCII code. It's distributed by R.O.M.

It *seems* to be PD now. Use Archie ...

10.11 GDOS-Font

Filename: GFONT112.LZH
Shareware with limitations
GDOS-Font 1.12 (Aug. 22nd 1994) by Holger Weets@ol.maus.de
Display and editing of GDOS fonts, including or removing them in the
ASSIGN.SYS! = Never more manually changing the ASSING.SYS, GDOSFONT does it for
you!

10.12 REFONT

This Program converts Type-1 fonts between Mac- Unix- and Windows format and TrueType fonts betwenn Mac- and Windows. But no conversion from TT to T! or vice versa (Stef: :-/=)

11 Font selectors

We all know this useful thing about file selectors:
The Operating system soesn't only offer a file selector, it's got an interface to use own file selectors in every application.

A scaled interface for FONT selectors doesn't exist, normally they're offering their jobs by cookies. The work to make a program support font selectors via cookies is much smaller than writing one for yourself. If there wouldn't ... but let's take a look at the candidates first.

11.1 UFSL

UFSL from Michael Thaenitz is freeware and is allowed to be distributed with any application. The last version is 0.97 from April 30th 1994.

Fonts (faces) and size can be selected comfartable. But I didn't get a face displayed after selecting a free size.

Attributs are missing and the dialoge is only modal.

UFSL sadly isn't in development no more.

11.2 XUFSL

This font selector is the one with most features - compared to the other ones mentioned here. It even can handle Speedo 5 (and NVDI 3, note by Stefan) too.

Version 1.03 is stable and UFSL compatible. The following setting are possible:

- Font size
- Kerning informations (Pair & Track kerning)
- Skewing angle
- Color
- Attributes

And it is (almost) totally keyboard controllable and shows the actual font ID.

At first test I only found some non-important flaws (flat hand on popup). But it would be a nice feature to (totally) hide disabled setting.

This file selector is to be supported further on (1.05 is the actual release) and - public - beta, until there's a fix definition about font selectors.

11.3 Magic from Peter Hellinger

This selector is part of Magic 4.00 from Peter Hellinger and not available separately. Magic itself - NOT MagiC! the multitasking OS - can be copied freely. But the information how to use it must be paid.

It's nice that this selector can be set in a non modal dialog, FlyDial or normal dialog. Scrolling through the list is fast too.

Attributes aren't selectable and the size selection in the edit line isn't acceptable the way it's done.

The selector only can be used when the event handling is completely done by Magic, what makes the coder use a fixed code structure (working parts must be rewritten, other things don't work anymore) and produces new errors.

11.4 FontSel

FontSel from Holger Weets is totally cmpatible to UFSL for the programs. It's small size and the selecteable attributes are a very nice feature.

Version 1.00 from May, 11th 1994 only shows the System Font when using Speedo 5.0a.

11.5 Minimum requirements

A Font selector should work with all OS-releases (TOS, MiNT, MultiTOS, MagiC!, Geneva). Plus with every video hardware supported by the VDI and should show each font available from every GDOS version. (Pixel fonts, Speedo fonts, Type1 and TrueType).

11.6 Characteristics liked to be seen

11.6.1 Attributes and selection

Its quite complicated to make the user set further characteristics of fonts in an extra dialog. So, at least the standard attributes (bold, outlined, ...) should be directly made available. If a program doesn't support them they should be made non selectable.

Same with the skew angle.

Not every program can handle all fonts. According to this every program must be able to set, which faces have to be invisible or disabled.
An example:
Some programs (like 7up) only use non proportional fonts.
A further feature (but not exlusively, due to BASIC) it should be possible to pipe a procedure variable to the selector setting the kind of displaying for each face.

11.6.2 Windows and event handling

It would be nice if the program could set the selector in a window or normal dialog too. It can be done much easier and more flexible than in Magic.
The font selector opens a window in the calling program's name and gives back the window handle to it. The application further handles the events and if one is for the font selector's window it is passed to it via a procedure call. This simple mechanism enables the use of multiple (system wide) selectors, colour pickers (and more) distributed by different producers being in windows on the screen the same time.

Once more:
This parallel work only is possible when no selector uses
its own evnt_multi loop.

Almost all utility coders want to make it the other way (and do so). So, let me show you, what happens, when utilities make their own evnt_multi call and set unhandled events to the application:

In this case there are several utilities for an application, all making the evnt_multi call themselves. One of those utilities makes this call, can't work with it and gets it to the application. And now? What should the app do with it? It isn't able to get this event to other utils, but one of'em has to handle it. But all utils won't take any events from the app ...

Due to this an app can use one (window) utility as maximum. If an app uses Magic (by Peter Hellinger) it can't use *any* utility.

11.6.3 misc

Finally an application should be able to set if it doesn't matter if a font is proportional or not (the user can have displayed it if he really wants to). When not using this information the call of a selector can happen much faster!

My favourite selector actually is the one of papyrus, but it only works in papyrus (yet?) [Stefan says: It's my favourite too ;-)]

11.7 About dialogs

This subtopic is quite off topic to this FAQ, but I think it fits here. Take it as a note by me about Tim Oren [22]

I was quite curious about why I like papyrus' font selector much more than XUFSL. This one does include all features offered by the new libraries. *And* it doesn't break any design rule I've read.

So I'll try to write, what's disturbing me intuitively [hrrrgn, note by Stef] And that's not about font selectors but about dialogs in common - but fixed to a concrete example ...

The popups (with sliders) are, what's disturbing me most.

State-of-the-art user interfaces (Gerd writes "Benutzeroberflaechen", but in German it's "Benutzungsoberflaechen", the first is the user's skin <g>) offer selection instead of input (like those *�&" MS-DOS programs). To make this possible, the selectable thing have to be visible at first sight.

Popups surely can't show everything. And if there are more of'em it's impossible to take a short look, but one has to take a deeper check what's available too. Plus one more mouse click to open the popup.

For the theory: Popups are modal parts in non modal (or worse: in modal) dialogs and modal dialogs are quite interrupting (not only to the user!)

Popups don't fit to the ideas of intuitive user interfaces. I know you're proud of using Popups (even with sliders) but please: don't use them if possible.

(Note by stef: file selectors are soon not out of concurrence, there's a new - non modal - one, released early '95! Looks nice, I recently got it. FREEDOM 1.0 beta;
Note by Gerd: It uses a different mechanism than described above; it needs an additional process)

12 Distribution

12.1 Atari

The drivers named with Atari are availabel from Atari. Send three disks, Money for shipping and a letter to them and you'll get them with printer drivers and fonts.

This Package is available at Atari shops too.

No docs but for this price ...
(That's the way in Germany - other countrys may differ!)

12.2 BELA

The fonts named BELA were available from BELA

There were two disks with packed printer drivers and fonts for them.

The fonts DO have the same IDs like the ones from Atari, but the internal font NAME is different. Due to this these fonts are correctly not accepted by some programs if used with Atari fonts.

There's almost no documentation. Not even a hint about the one owning the copyright for the drivers or about the author(s)

One last thing about BELA: R.I.P. ;-)

12.3 Language

The driver named Language is spread on the language disc of the MegSTE

12.4 Internet

The drivers signed with 'I' are to be found in the Internet.
For example: ftp.cs.tu-berlin.de

12.5 Working Title

The WT drivers are spread with Calligrapher. They are (c)Working Title, the wt driver are licensed by Working Title.

No drivers are on the Calligrapher DEMO-disc. The drivers coming with Calligrapher-lite (15DM) are signed with CL in the tables.

Screen fonts are on both discs.

12.6 X Window System

There are PD Speedo fonts from Bitstream. These can be used with Speedo 4.2. I (Gerd) have no problem using them (even the umlauts are correct)

To find them let Archie (see 11.12 FTP) search as follows:
set search sub
prog speedo-

The fonts
font0648.spd -bitstream-charter-medium-r-normal--0-0-0-0-p-0-iso8859-1
font0649.spd -bitstream-charter-medium-i-normal--0-0-0-0-p-0-iso8859-1
font0709.spd -bitstream-charter-bold-r-normal--0-0-0-0-p-0-iso8859-1
font0710.spd -bitstream-charter-bold-i-normal--0-0-0-0-p-0-iso8859-1
font0419.spd -bitstream-courier-medium-r-normal--0-0-0-0-m-0-iso8859-1
font0582.spd -bitstream-courier-medium-i-normal--0-0-0-0-m-0-iso8859-1
font0583.spd -bitstream-courier-bold-r-normal--0-0-0-0-m-0-iso8859-1
font0611.spd -bitstream-courier-bold-i-normal--0-0-0-0-m-0-iso8859-1

12.7 COMPO

COMPO offer two Bitstream Speedo packets with 100 fonts each. One costs
DM99.-
(At your own risk)

Since some time COMPO also offers a CD-ROM with TrueType and Type1 fonts/faces.
These seem to be the same ones as on the StarType CD, but TrueType and Type1
on a single CD-ROM.
The price is DM99.-

12.8 IMG-0300

In the Internet:

ftp.uni-muenster.de /pub/atari/Gdos

12.9 FTP

Many students can get software worldwide via ftp. Prices for steady
connections are constant, but connections between America and Europe
have to be paid depending to the volume of data transferred.

Please try not to ftp across the big blue and use short ways.
Use transferring times not in the range of working at the server!
('9 to 5')

Files with known names can be found by Archie.

In Germany:
telnet archie.th-darmstadt.de
login: archie
help

In the US e.g.:
archie.ans.net

Archie will automatically display other archies. use the one thats' closest
to you.

The Archie databases ask about once each month one ftp server after the
other for freely available files

One more small hint: atari.archive.umich.edu ist always totally busy. Not
even mirroring to other servers helps.
Better connect to
- amiga.archive.umich.edu
and type cd atari from there.
This computers have the same HD mounted. BUT: First search your own vicinity!

12.10 SciLab

SciLab's GDOS drivers are not mentioned in the driver's tables though they
are very favourite - specially the colour drivers.

These drivers no langer can be ordered without a program. This is due to the
programs that lots of programs have when using the colour drivers. SciLab
would be blamed then.

You only can get these drivers by ordering a program from SciLab or making
the distributor (of the software you use) licensing those drivers. SciLab
always has 'an open ear' for that. Those are especially the Speedo capable
drivers for HP 600dpi and HP 500C/550C. Actually these are distributed with
Speedo 5 too.

12.11 Star Division

Star Division sells two CD-ROMs (StarType) with 500 TrueType/Type1 fonts/
faces. These are mostly complete packages of fonts.
One example:
Zapf Humanist 601 is available as:

o roman
o italic
o bold
o bold italic
o demi
o demi italic
o ultra
o ultra italic

(Stef: and lotsa Swiss 721 ...)

A lot of Bitstream fonts are included. (e.g. Zapf Humanist 601 as noted above)
There are two ITC faces too. In Germany these two CDs are (at least)
available for DM69.- from Vobis. A booklet with a short overview is available
there too.

12.12 Thierry Rodolfo

Thierry Rodolfo made the drivers with T.R. as note.
You'll find them in the BBS BRASIL and on
ftp://hensa.micro.ac.uk/atari/tos/n/n196/...

12.13 Others

I don't make a choice of drivers. The limit is all of them. The authors (and
users) of the programs are asked now to write me, which GDOS drivers come

with the programs (With information of: Codelenght, Date and known bugs).

A comparison of TrueType collection CDs is found in [29]

Anyone using one of those low priced CD (500 faces for $9, DM15, £6) shouldn't take care of Umlauts (Stef: I still recommend "vowels" for this ...), kerning or a good looking print image. *Then* it's not ugly to use more than 20 fonts on a poster (*sigh!*)

13 GDOS versions

13.1 The ones from the bones

Atari-GDOS, AMCGDOS, ABCGDOS, NVDI and possibly G+Plus use the same drivers.

13.1.1 Atari-GDOS and AMCGDOS

The Atari-GDOS is the father of each GDOS coming after it. It's most remarkable character are lots of bugs and it's horrible slow speed. But that's history.

AMCGDOS is faster and has less bugs. But it almost has the same capabilities and was distributed together with Atari-GDOS. (stef: This one works with MagiCMac!)

13.1.2 ABCGDOS

Comes from The Netherlands (I think so) and is almost totally unknown. I only mentioned it because it's a GDOS.

13.1.3 G+Plus

Does anyone know anything about it?

13.2 One step forward

Even though there was a very good GDOS in NVDI, Atari had an open ear to the request of users and coders and tried to raise the capabilities of GDOS.

13.2.1 FontGDOS 2.0

This is a GDOS still using bitmap fonts. It uses own drivers.

The drivers from this package are really much faster than the former ones. (Only bitmap fonts and graphics are comparable of course)

I didn't have any problem using these with other GDOS versions but you must limit to the old fonts.

FontGDOS is the follower of the Atari GDOS. Mainly it differs with the Bezier function and faster (and color-able) drivers. It's got nothing to do with FSM-GDOS or SpeedoGDOS.

FontGDOS is availabel from several firms which use it for their programs.

13.2.2 FSMGDOS 3.0

During the development of FontGDOS, Atari created a GDOS that can handle vector fonts (named OTL in this FAQ). So FSMGDOS isn't a follower of FontGDOS, but was developed the same time. FSMGOS practically was ready to be released but due to massive protest by the developers it was cancelled in the last moment. Except to bundles it never has been distributed officially.

13.3 Actual developments

13.3.1 SpeedoGDOS 4.0 and 4.1

See [5]

The information if it's a Speedo or bitmap font can be found in byte 33 of the Fontname (vqt_name, INQUIRE FACE NAME AND INDEX, VDI 130). zero means bitmap font and one means FSM- or Speedo font.

Some Problems are inportant to be mentioned:

A coder can't find out if a driver can handle Speedo fonts (see last question in 10.3)

Some font IDs are used by bitmap AND Speedo fonts, though different fonts with similar IDs may never be installed the same time.

If you don't take care of this you'll get bombs.

It depends to the user to install the right drivers and fonts. The coder can't help here to stop errors.

The best way is only to install bitmap fonts with the right drivers or to use a Speedo only system.

The monospace font coming with SpeedoGDOS 4.0 has no umlauts (ae, oe, ue ...)

SpeedoGDOS is still in development, ignore the note in [17].

For installation and coding best is to refer to [6-8]
Remember starting NVDI before SpeedoGDOS in the AUTO-Folder!

The ones that bought Speedo got 4.0, the Falcon buyers got 4.1

13.3.2 Speedo 4.2

Let's see, what Ulli Ramps has to say:

Huhu! [TM]

The following is a list of changes made to SpeedoGDOS.

1) Line-A - Due to many requests from developers, SpeedoGDOS is now no longer Line-A dependent. All output is done through VDI calls. This was done to make Speedo compatible with various graphics cards, and to make it more multi-tasking-friendly. In addition, users should be able to use various VDI replacements with GDOS.

Another benefit from removing the Line-A dependency is that we no lon-
ger have to worry about the scratch buffer used for algorithmic spe-

cial effects. We have implemented the special effects inside of SpeedoGDOS and the drivers, so that the user/program does not have to worry about the memory needed to accomodate arbitrary sized characters. Unfortunately, this means that old drivers need to be relinked with the new independent library (found in the new driver kit).

There are plusses and minuses of the new implementation of special effects. In many cases, the special effects will be slower. With all previous incarnations of GDOS, you could not use 'bolding' or 'skewing' at non-90 degree rotations; now both of these work at all rotations. On the other hand, 'lightening' used to work at all angles and combinations of effects; now 'bold' mixed with 'lighten' only work at 90 degree rotation angles.

Miscellaneous Note - When using special effects, many applications have a hard time placing the cursor. In both the v_gtext() call and the v_ftext() call, the only cursor compensation to be made is for bolding. Bolding adds the thicken value to the number of pixels of each character. For rotated characters, note that the extra pixels can be considered a vector along the positive x-axis which is rotated at the same angle as the text and added to the advance vector; therefore, the length of the text string should remain the same at any angle. This is true even when SpeedoGDOS generates characters on a scanline basis (when the character does not fit in the character cache), although it does not implement the special effects. Also, applications should watch for the case when they keep track of the cursor position with vqt_advance() or vqt_width(), instead of vqt_extent() or vqt_f_extent(). In versions prior to 4.2, the application could accurately place the cursor by adding two pixels for every outline character and by adding left and right skew offsets for a skewed string. Now these effects are generated by the outline font engine, so the application must either rely on the extent calls or it must inquire for the advance vectors for characters that are skewed and/or outlined separately. For compatibility purposes, it is recommended that the version number of SpeedoGDOS is checked so that programs can handle both old and new characteristics.

2) Font ID's - Speedo font id's have been promoted to a higher range of ID numbers. This was introduced to avoid conflicts with bitmap fonts and more importantly, with the system font (which conflicted with a variation of Swiss 721). For those applications which use the usual interface with Speedo (i.e. use vqt_name() to find out what the font ID's are), there should be no problem, except if documents have font ID's embedded into formatting information. Of course, all the user has to do is substitute the font. If the application actually goes into the font file header to read the ID, note that we are adding 5000(decimal) to all Speedo font ID's.

3) Printer Driver Incompatibilities - Speedo will now check the printer driver it is trying to load for the '_FSM_HDR' cookie embedded in the driver header information. If GDOS does not find the cookie, it

will not allow the loading of any fonts; therefore, you can still use your driver for non-text applications. For future reference, please be sure that the driver header begins on a word boundary for all drivers to be used with this version and any future versions of GDOS.

4) Vst_load_fonts() - We have made two optimizations to the loading of fonts. The first is when a load_font call is made, GDOS checks the date of the extend.sys file to see if it was modified since the last load. A reload used to be mandatory because a bigger scratch buffer might have been required. Since we no longer need a scratch buffer, GDOS only checks to see if a change has been made to the list.

The second change is that GDOS no longer deallocates the global list of fonts if there are no more workstations using GDOS fonts. Therefore, application launches will be faster. On the other hand, the miscellaneous cache never gets cleared of font header information, unless a reboot happens.

5) Memory.sys - The memory driver used to mistakenly open a printer handle.

6) vst_height() - Vst_height used to have a bug in which a maximum point size is reached and then the size begins to shrink. This is fixed.

7) Postscript table - The Postscript table has been fixed (i.e. the indexes were off by 32 for certain Postscript files).

8) Fixed vrt_copyfm() in the drivers.

9) When in 'bicsmode', character 0 was not passed through to the font engine.

10) Negative point and set sizes - The handling of negative point and set sizes has been made consistent with the original handling in FSMGDOS.

11) The handling of fractional setsizes was incorrect in the drivers, and is now fixed.

12) V_ftext() in the drivers can now handle the offsets passed into the ptsin array.

13) Screen drivers can now safely load as device 10.

14) The memory driver can be loaded residently.

15) vqt_devinfo() - Vqt_devinfo() now returns information, whether or not the device has been opened. Furthermore, the device drivers name, found in the driver header, is copied into the ptsout array; the name is 26 bytes long. Note: if the driver is not SpeedoGDOS-compatible, a null string is returned, and if there is an error, a -1 is returned in ptsout[1].

16) vst_width() - A new call has been added to Speedo. The call is similar to vst_height() except that it sets the width. The bindings are identical except that the opcode is 231. Note: As with vst_arbpt() and vst_setsize(), you must call the general call (i.e. vst_arbpt() or vst_height()) before using the width calls (i.e. vst_setsize() and vst_width()). In addition, the general calls always reset the widths.

Miscellaneous Note: Although these have been published before, many requests have come in for the SpeedoGDOS error codes. Here they are:
Code 1 Out of memory
2 File open
3 File read
4 File write
5 Speedo engine error
6 Character too large (not used, defaults to line output)
7 No room for scratch buffer
8 Character cache error
255 Miscellaneous
These errors are placed in the error code address that applications should provide. Note that if you have MultiTOS installed, GDOS will report the error to Salert, the system alert box. A revision of the error handling is overdue, since some of the errors are no longer relevant (e.g. code 6), and error code 5 is returned for the lack of availability for pair and track kerning (in addition to the serious errors).

Well, again a big thank you to Ulli!

Now it's me again:

The Installation program for Speedo 4.2 had a small bug yet. If a NEC P printer is selected, NEC_P.SYS ist written into ASSIGN.SYS. But the distributed driver hat NECP.SYS as filename. R.O.M. fixed that.

13.3.3 Speedo 5.0

SpeedoGDOS 5.0 was developed by COMPO/no!software using the sources by Atari.
More than Speedo 4.x it can scale TrueType and Type 1 (see 7.2). Price: DM129.-
(at your own risc)

Now 9 printer drivers are included - the additional ones. Speedo 5.0 is an upgrade, so you have the other drivers. But: Which are the old divers? The ones before Speedo 4.1 don't work (and only falcon users have 4.1; the ones who bought Speedo from COMPO in the beginning only got 4.0)

So I at once printed a text using Speedo 5.0, NECP.SYS (Speedo 4.2) and ProList. And? Surprise! It works. That's really astounding because ProList and my own program (see 2) had problems with this driver and Speedo 4.2.

Using the drivers of Speedo 4.0 at least shouldn't work due to the changed jobs of Speedo 4.2 and the drivers.

(Could anyone test Speedo 4.1 drivers with Speedo 5.0? I don't quite believe this works)

Here's how I think an upgrade works (be careful satire)

==========
User: Dear Mr. Compo [...] but my Speedo 4.0 drivers don't work any more.

COMPO: ... best wishes to your decision ... BUT: Speedo 4.2 isn't an official release. It's especially made for papyrus and not useful for other programs. On the other hand...though...seen from a different point...maybe...possibly...Finally you need the drivers from Speedo 4.2. But we don't distribute them. Ask R.O.M. about it ...

[later]

USER: Dear Mr. R.O.M., ...I'd like to get a downgrade, free of course.

R.O.M.: ...don't work...our own costs...bla...etc...better wait for NVDI 3.0, we certainly can put you on the list.

User: "$&"$/(!&!^#
==========

Well, *I'm* full of anticipation how users that only had Speedo 4.0 will be able to make printouts.

Versions of Speedo 5.0 until now:

5.0a (Aug. 3rd 1994)
First release

5.0b (Aug. 8th 1994)
From now T1 & TT font loading works faster.

Known Bug: After calling vqt_headerinfo() the files arent' closed again. Whe using programs making this with all fonts there maybe can be no more filehandles (the amount of them differs from one TOS release to another).

Since Speedo 4.2 the 'outlined' attribute only works in special conditions. It depends on the font used, the SpeedoGDOS version, the point size ... and which Mantra's are mumbled at full moon.

5.0c (Aug. ? 1994)
From here LOWMEM=0 works like noted in the manual.

Now LOWMEM=0 works as stated in the manual.

13.3.4 NVDI up to V2.51

These releases were made of very fast screen drivers and a very fast GDOS. Compared to Atari-GDOS, NVDI had almost no bugs. But there functions weren't almost any more functions.

13.3.5 NVDI 3.0

From 3.0 NVDI is capable of scaling Speedo and TrueType fonts. Different from SpeedoGDOS it can't scale Type1. The Behne brothers (correctly!) say this format has least capabilities and only would blow up NVDI. But lots of special fonts are only available as Type1 and I could use some of them. But since the existence of Multiple Master fonts (see 7.3.5) I don't think the decision was that good ...

A (by principle very good) conversion of the formats is possible but very difficulty (see chapter 7.4) and no Atari program doing this exists yet. So the Behne's decision has advantages and flaws.

NVDI's printer drivers are found in 5.7.3

bugs and problems (I know about):

o All released versions of NVDI ignore the pixel size relation. (aspect ratio) for output of circles and ellipses.
o when calling v_clswrk after vqt_devinfo to a physical workstation creates a privilege violation when using MultiTOS. With NVDI 3.02 we'll get rid of this bug
o The character mapping isn't compatible to SpeedoGDOS 5.0
o There's no alert when you try to install NVDI (release before November '94) on a full (hard)disk.
o You'll get a memory violation when using the cache CPX with MTOS. Again, wait for NVDI 3.02.
o Output of rotated text doesn't work with some fonts (e.g. MONACO08.FNT), the chars are always set to 0 degrees.
And bitmap fonts with 8pt or less aren't light when this attribute is set. This happened when using the monochrome driver and the 8pt system font; not woth other fonts or bit depths. Fixed since Nov. 10th '94
o vpt_fontheader get's an incorrect TDF path.
o Track kerning doesn't have effect.
o When a skew angle is set, vector character's positions aren't located correctly. Once a skew angle is set the text is moved to the left or right (depends on the skew angle - positive or negative). This doesn't happen with SpeedoGDOS. Will be fixed with NVDI 3.02

13.4 Comments

Users and coders should be happy with the speed of development. Even the numbers of font format included in the programs doesn't have anything comparable on any other platform.

The time between the releases of SpeedoGDOS 5.0a to 5.0c - making one think there wasn't much of betatesting - doesn't satisfy a lot but, on the other hand it's nice to see that the competition by NVDI 3.0 makes the developers hurry.

SpeedoGDOS 5.0 creates problems in some applications that worked perfectly with Speedo 4.x. This may be due to the negative handles that 5.0 uses for the new formats. That's not a bug, because one shouldn't calculate with handles. But some apps do it though.
The coming workaround is the interpretation of handles as unsigned integer (SHORTCARD).

For coders the manuals coming with SpeedoGDOS 5 and NVDI 3 are only a bad joke. Even simple user's questions aren't answered:
TrueType (and Type1 with SpeedoGDOS) are handled. But these fonts are created in platform specific formats. Which ones are handled and what files with what extensions are needed? Without this information both programs aren't very useful.

But the developers of both programs promised to spread the coder documentation by BBS's (Actually the NVDI docs are finished. There's a ST-Guide HYPertext version of it too).

A provisional coder documentation is free on request when updating to SpeedoGDOS 5. You only have to *know* that it's possible. Sorry for this late information but I didn't know this before too. It's still available (for three Deutschmark in Germany by sending a stamped envelope addressed to yourself). It's 90% Englisch and 10% German, so it's sent to foreign countries too (Stef: try your country's COMPO dealer?)

Here some more differences between NVDI 3 and SpeedoGDOS 5. Get your own clues.

o The driver's concept
A real plus for NVDI 3. They're small, fast and
easy to be configured by the user. But they're not able to print with colours yet! And setups aren't to be copied, due to everything set in one file.
o Print to files
NVDI drivers can print in a file and the program won't
notice this (SpeedoGDOS can't)
o Need of RAM.
NVDI 3 needs about as much RAM as SpeedoGDOS 5 and NVDI 2.5 (when using the same cache sizes with both GDOS versions)
o Installation
NVDI 3 is begginer-friendly to install BUT: Everything
having the same name as a file to be saved is overwritten without any request to the user: META.SYS and the old Screen drivers. This makes different configurations for testing quite difficulty.
But this may be more interesting to coders (and freaks) and they'll be able to rename the old folders before, aren't they ?-)
Only since November '94 there's an alert when there's not enough disc space for NVDI 3.0
o VDI Speed
NVDI 3 is a bit faster than SpeedoGDOS 5 and NVDI 2.5, which is
much faster than SpeedoGDOS 5 without NVDI. But SpeedoGDOS 5 and NVDI 2.5 can be enough. This combination is about as fast as NVDI 3 when the fonts used fit into the caches.
o Scaler Speed
Both scalers are the same. Don't look here, why SpeedoGDOS is slower.
o Bugs
Current changes here. I don't know, who actually has more bugs.
o Number of font formats
Only SpeedoGDOS has Type1 capability. Some of those fonts are very

expensive, but there are special fonts not available in other formats.
o The font's concept
Insiders are fascinated by NVDI's font concept. But you won't get the documentation for "normal coders" from the Behnes. Did'nt even Microsoft lose a t court for such actions?
(Stef: I guess the concept is close to Bitstream's recommendations (font suitcases and more). And Bitstream's docs aren't free too. I talked with the Behnes at the ProTOS fair about it)
(Gerd: There isn't anything about a font concept in nvdiguid)
o Via cookie NVDI claims to be like SpeedoGDOS 5.0, but (obviously) it isn't. But SpeedoGDOS 5.0 isn't SpeedoGDOS compatible too. Huh? You ask why? Well: There are several versions of SpeedoGDOS 5 (with different functions/opcodes) and none is documented. Even worse: Some SpeedoGDOS Version have some experimental functions which aren't allowed to be used. In the past functions *always* were documented that it's allowed to call VDI function to check their existence.

14 Source

Being a developer it's possible to get an almost complete printer driver in object code. This one only must be adapted to the special printer.

This package is available for GDOS and SpeedoGDOS.

15 Tips'n tricks for users

15.1 Pixel trash at printing

Printing graphics on a NEC P6+ (maybe other printers too) including a lot of black in a line I often had the problem that one line was left out (Speedo-drivers NB15, NECP) or two lines were printed displaced in one line (Speedo-drivers FX80, NX1000).

This happens when printing directly and via CENSPEED. When using VARSPOOL this effect is gone.

VARSPOOL can be found on the driver disk of the NEC-printers.

15.2 NEC P6+

Once in a while a NEC P6+ will get noisy (rrrrrrrrrrraattatatattaa).
When You open the front you'll see a round stick (about 1cm thick).
Put two drops of sewing machine oil on it each year (you'll get it from Mom)

15.3 Overwritten Speedo faces

Sometimes Speedo writes in face files producing interesting effects. To fix this I have a second order besides GEMSYS filled with the Speedo faces on my harddisk. If I get strange effects again I copy these files to the GEMSYS folder. The almost fixes it in most cases.

15.4 SpeedoGDOS & MagiC! (VT52.PRG)

Andreas M. Koepfer:
SpeedoGDOS 4.1, 4.2, 5.0b used together with MagiC! (former Mag!X) have a problem. When VT52.PRG has to be used it already has to be in memory to correctly start a TTP (or TOS??). Otherwise VT52.PRG scans the fonts, what takes longer than the time it has been given for that. Putting VT52.PRG into the APPS folder of MagiC! is a workaround for that. Then the booting takes longer, but no errors occur. *But* a lot of memory ist lost. I wrote Andreas Kromke - who sent the upper note about the timeout. I guess the new MagiC! release will have this flaw fixed.

The VT52.PRG coming with EASE 3.5 is fixed, ask ASH ...

16 Tips'n tricks for coders

16.1 Fontsize and Pixelsize

Here are my experiences with GDOS and WYSIWYG. Credits to Ulrich Rossgoderer for confirming these.

It's about the output of vector graphics and text on screen and printer.

The size of text is defined in point and is always the same - independent from the resolution of the output device.

Different are vector graphics: they have to be recalculated in pixels before the output. Should be no problem because when opening a virtual/physical workstation You get the pixel size in micrometers in devParm[3] and devParm[4].

Let's assume the vector graphic is saved internally in micrometers, then the definition points at the output simply have to be divided by devParm[3] or devParm[4] to get the position in pixels. When doing the output in windows an offset has to be added. but thats not relevant here.

So far for the theory being quite simple so to this point (see [4]).
Now for the practice.

As described above we output a text and a border - saved internally as vector graphic. It doesn't matter here if the text is a Speedo or bitmap font. To have a better chance to compare the border exactly surrounds the text.

Doing this I got the following experineces: The text exactly filling the border on the screen (ST-high) is - when printed - much too small compared to the border.

An error in the recalculation of the pixelsize can't be the problem, because I made the printing with the drivers NB15, NECP, FX80, NX1000 and the results are the same.

I have only one explanation for this: The screen driver supposes a different resolution for the pixel size than for the font size.

Two solutions I can offer:

First you can use another pixel size on the screen than the one given from the operating system. After opening the virtual workstation (and ONLY

this one!) I calculated
devParm[3] := 282
devParm[4] := 282
and with this parameter I made the recalculation from micrometers in pixels. Now the relation from graphic to text on screen and print-out is exactly the same. But now a DIN A4 page doesn't fit on the screen in it's width. The numbers are found by me the experimental way and possibly can be optimised

Another solution may be this: Use a smaller font size for the screen (and ONLY there!) by multiplicating the size with 72/96. This is simple with Speedo fonts because the size in points can be defined by almost endless values behind the point. Using bitmap fonts this won't work due to not having a screen font in the 72/96ish size for every printer font. (Different to translate this, sorry - SD)

This method surely is to be midified for ST-Mid and other resolutions.

From Wilfried Behne (Half NVDI ...) SpeedoGDOS ignores the devParm[3] and [4] - values of the screen drivers. The values of physical workstations ARE taken.

16.2 Selecting drivers

When testing several GDOS programs I found out, that some coders have problems
with the following reasons:

Users can freely assign drivers in the ASSIGN.SYS.
There may be a setup like

23 FX80.SYS
27 NECP.SYS
28 NB15.SYS
31 META.SYS
61 MEMORY.SYS

How may a coder find out which drivers are installed (and ready)? Even though there's no Printer 21?
Quite easy: When the program supports printers ALL drivers from 21 to 30 are to be opened and closed again at once. An installed driver gives back a devicehandle >0 when being opened. vf_devinfo gives back correct values when a driver is opened.

Do the same thing with drivers 61 to 70 when MEMORY drivers are supported.

The ASSIGN.SYS as printed above is very useful. That's because the NEC P printers support all these drivers and print in different resolutions.

16.3 The Metafile (MF) format

If been asked to count, what i don't know about Metafiles 8-)))

By the idea the Metafile format is quite simple. It's a recording of VDI calls (including parameters) made by a program.

A program making it's output via GDOS will open a Metafile driver instead of a printer driver (see 5.7) and the output will get there just like to a printer.

A Metafile reading program recreates this recording.

But the simplicity of this format is one of the biggest problems of metafiles because different GDOS releases exist and different drivers with different capabilities. So, one programs makes output being understood by the GDOS actually installed. When this Metafile is read by a program running under a different GDOS with less or different capabilities, how can the recording be recreated?

Concrete examples:
The length of ptsin and intin fields is limited (different for different drivers) usually. The Metafile driver can handle this in another way. This can have influence to text output, poly line & marker, filled area and more ...

Next problem:
A font face not available on the output system is used. I which way another (most similar) face has to be requested by the program making the output?

At this point, this is a problem to be handled by the coders of the reading graphics programs (who willknow, what they're doing).

But when writing a metafile header you have to know, what you're doing. I don't but I'll give it a try ;-)

The resolution set for a metafile is a decision of the application. If there's no resolution set, 300dpi are used. That's a pixel width of 0.085mm

(Stef: that's not a pentium calculation, but *where* are 300dpi equal to 85 micrometers? On a 72dpi SM124?
Gerd: everywhere)

Screen drivers are only capable of handling raster coordinates. For metafile output the same routines are used, so I'll limit the next info to raster coordinates (even though metafile can handle NDC's). Those coordinates are defined from upper left to lower right.

To define a system of coordinates, metafile do this:

o (W)idth and (H)eight are set in millimeters (mm) via vm_pagesize. That's the (positive) difference beetween the lower right and upper left corner (which doesn't have to be in the origin)
o The rectangle (xmin, ymin, xmax and ymax) is defined in pixels via vm_coords. The way to calculate this rect. is found below.
o Here inside another rectangle is defined in pixels via v_meta_extents. It's got nothing to do with the system, the MF reading application get's info how to clip (what doesn't *have* to be done!)
Note: papyrus doesn't clip; kandinsky does, but it moves the graphic

to the lower right a bit making miss a bit of it on the screen.
So it could be useful to set the size for v_meta_extents a bit
larger than the one for vm_coords.

This way the system of coordinates, the resolution (width and height of a
system) has a fixed definition.

But the veriables set aren't the ones an application usually calculates
with.
Here's an example what's to do, when the application knows the resolution
wished (in dpi), the upper left (X1,Y1) and the lower right dot in tenths
of a millimeter (or a multiple of it).

Here's how to get the width and height of a pixel by the resolution:

25400
(Pixel height in tenths of a millimeter) = --------------------
vertical res. in dpi

25400
(Pixel width in tenths of a millimeter) = ----------------------
horizontal res. in dpi

(W)idth and (H)eight (in millimeters) are needed for vm_pagesize:

W = (X2 - X1 + 1) * (Pixelwidth in 1/10mm)
H = (Y2 - X1 + 1) * (Pixelheight in 1/10mm)

xmin, ymin, xmax and ymax (in pixels) are needed for vm_coords:

X1
xmin= --------------------
Pixelwidth in 1/10mm

Y1
ymin= ----------------------
Pixelheight in 1/10mm

X2
xmax= --------------------
Pixelwidth in 1/10mm

Y2
ymax= ----------------------
Pixelheight in 1/10mm

v_meta_extents is found the same way as vm_coords. To make Kandinsky
display everything, xmin & ymin can be set smaller and xmax & ymax larger.

Before making any output into a MF, first set the system of coordinates.

(In the early past I noticed, that my desriptions are that good, that even
I understood them <g> [Stef:I hope the translation is that good too])

Further informations:
Ulrich Rossgoderer coordinates a list of further informations to put
in a MF via v_write_meta (See version 2.4 of this FAQ). The Profibuch [2]
the Atari Compendium [3] and the standard book "Ueber FIleformate [20]
contain further information. And every literature about VDI calls is helpful,
too.

16.4 Anticipation is half the fun - I've been told ;-)=

17 Addresses

(Lot's of stuff is available from the friendly Atari dealer 'around the
corner ;-/)

(Note: All addresses are German ones - except when marked!)

18 Miscellaneous

18.1 Critics

18.1.1 Critics to the author

Critics are greatly welcomed. To get more info, send email to:

G.Castan@physik.uni-stuttgart.de

Possibly one writing me has already tested two or three drivers.
Please write me if the errors listed above occured or not.

Anybody knowing different driver support addresses, please write me an
email.

18.1.2 Critics to the translator

Hi, this is Stefan writing :-)
The reason why I wrote this translation I can't find in my head ...
Guess it's because Atarians should work together and support each other!
Well, if you wonder about some errors of spelling or syntax remind this:
I learned English at school for 4 years and after that I kept my knowledge
actual by playing some text adventures and reading some international
newsgroups.
If you find some errors in this translation, please don't send them to Gerd
but
to me:

cookie@cookie.syd.de

Referring to the feedback on this translation there seems to be ANY error in
it.
I didn't get too much email now - and no postcard, so I'll set my address
here too: Stefan Damerau
Bergholm 31
D-24857 Fahrdorf

It would be interesting to me, WHO is happy with this FAQ, so send me
postcards,
discs, books, whatever you want - no mail bombs please ;-)))

Thank you and have fun and lot's of experience with this FAQ.

Bye
Stefan

18.2 Praise

If this FAQ helped you out of a problem, please write me a postcard in your
next holidays.

Postcards I received yet: 1

18.3 For my support

Due to actual experiences I ask the distributors to switch on verify when copying update disks.

I only know two distributors not making any problem with this.

Does one of the readers want to code a Speedo font editor? We (Gerd & Stefan) offer our time to beta test it ;-)

18.4 Trademarks

This document is full of trademarks, no to be used freely.

18.5 Guarantee

I'll offer no guarantee.

19 Appendix

19.1 Literature

[1] Douglas N. Wheeler,
EVERYTHING YOU EVER WANTED TO KNOW ABOUT GDOS (AND MORE)
(Internet, Filename: GDOS.ARC oder GDOS.TXT)
Here's written all what's important to know about GDOS drivers.
(AND MORE)

[2] Jankowski, Rabich, Reschke
Atari Profibuch [Professionals book]
10. Auflage, SYBEX, Duesseldorf (1992)
The Standard. For Coders: In the VDI part you'll find how to use screen and printer drivers correctly.

[3] Scott Sanders,
The ATARI Compendium, first revision, SDS Publishing, Long Beach '94
Another standard. More actual compared to the Profibuch (VDI calls up to SpeedoGDOS 4.2) and very complete. The official GEM user interface guidelines are included too! But it can't replace the Profibuch.
A plus is the list of operating system functions, from which release they're available and which way their existence can be requested.
If this FAQ ever will have a chapter about layout, this book will be an example. A negtive one, though.

[4] Marc Rene Gardeya
VDI fuer jedermann [VDI for everyone], ST-Computer 10/93
Introduction in correct programming of screen and printer outputs.

[5] Julian Reschke
Herbstgedanken, ST-Magazin 11/92
Autumn thoughts about SpeedoGDOS and FontGDOS.

[6] Erik Dick
Schoen und schnell? [Pretty and Fast?] , ST-Computer 7/93
Common info about GDOS and installation of Speedo. Almost the same

standing in the installation manual, but more information about
special problems

[7] Erik Dick
SPEEDO-Gonzales, ST-Computer 8/93
Important stuff about programming Speedo. Description of the new
bindings tips for coders for standard-uses.

```
!!! SPECIAL EXHIBITOR FEATURES !!!

******************************************************
NEWS RELEASE 12: THE TORONTO ATARI FEDERATION PRESENTS....ACE '95!!
******************************************************

_/_/_/
```

incredible FIRST in the Atari world. Imagine logging to
your favorite Atari BBS and being able to NAVIGATE
simply by pointing and clicking on ICONS, having
multiple WINDOWS open - downloading, looking at
graphics, typing e-mail, and more!! Does it sound
INCREDIBLE? Well ... it's TRUE and it's HERE and it
will be featured at ACE'95!! Christian will have
SEVERAL computers running (& interconnected), to
demonstrate this SPECTACULAR piece of programming.
Don't miss the SHOW!!

The *GREATEST* Atari Exhibition in *YEARS* is happening on April
1st & 2nd, 1995, in TORONTO!! Look at this incredible *GROWING*
ACE '95 Exhibitors List:
LLLL Gribnif Software!
LLLLL TOAD Computers!
LLLLLL Branch Always Software!
LLLLLLL Cybercube Research (Cyrel)!
LLLLLLLL DMC Publishing!
LLLLLLLLL Scarborough Computers!
LLLLLLLLLL Missionware Software!
LLLLLLLLLLL ICD INC/4Play/Black Cat Designs!
LLLLLLLLLLLL It's All Relative!
LLLLLLLLLLLLL ABC Solutions!
LLLLLLLLLLLLLL Esquimalt Digital Logic (OMEN)!
LLLLLLLLLLLLLLL GEnie Information Services!
LLLLLLLLLLLLLLLL Suzy B's Software (& CDs)!
LLLLLLLLLLLLLLLLL chro_Magic!
LLLLLLLLLLLLLLLLLL Clear Thinking!
LLLLLLLLLLLLLLLLLLL Schauzmoll Software (The first GUI BBS)!
LLLLLLLLLLLLLLLLLLLL Aodyne Software (ExtenDOS)!
LLLLLLLLLLLLLLLLLLLLL Oregon Research Associates!
LLLLLLLLLLLLLLLLLLLLLL Computer Direct! (DirecTT030 & an
LLLLLLLLLLLLLLLLLLLLLLL enormous lineup of Atari products!)
LLLLLLLLLLLLLLLLLLLLLL Binary Sounds!
LLLLLLLLLLLLLLLLLLLLL Fine Tooned Engineering (MIO2, Sweet 16)
LLLLLLLLLLLLLLLLLLL Compuworld (Service, Parts, Upgrades!)

... shhh! don't tell anybody, but the c-lab falcon mkII
is going to be at ace'95, too!!

We're looking forward to CGS Computerbild's presence too, as well
as COMPO, Migraph, Wizztronics, Best Electronics and *many*
more!!

****
FEATURE EXHIBITOR > Fine Tooned Engineering of Scotts Valley,
******* California
Mike Hohman (the owner of Fine Tooned) will prove to one
and all that ATARI 8-BIT COMPUTING is alive and well!!
He'll have his huge product lineup an will be filling orders

for his BRAND NEW MIO2 HARD DRIVE INTERFACE, as well as
debuting SWEET 16 ... nothing less than an amazing
16 BIT UPGRADE for 8-Bit computers! Mike is widely
regarded as one of the Atari 8-Bit GURUS. So if you
need the very best for your 8-Bit, ACE'95 will be the
place to find it! WOW!!

The next ACE'95 News Release will feature still more debuts and
exciting product announcements (how'd you like to use the
Grolier's encyclopedia on your Atari .... hmmm?) Stay tuned!

=-=-=-=-=-=-
ACE'95 will feature continuous, hour-on-the-hour SEMINARS and
LECTURES. The ACE'95 CREATIVITY CONTEST is also gathering speed
with 20 entries already!!! There are an a-m-a-z-i-n-g number of
creative Atari users out there!!! SEND IN *YOUR* ENTRY AS SOON AS
POSSIBLE!!! The Prizes are fantastic! STRUT YOUR STUFF!! Send
all entries to: ACE'95 Creativity Contest
5334 Yonge St. Suite 1527
Willowdale, ON
Canada
M2N 6M2
Your BBS will have a file called CONTEST.TXT, which contains all
the ACE'95 Creativity Contest Rules (there aren't very many ...)

=-=-=-=-=-=-
A fabulous lineup of Door Prizes, Creativity Contest Prizes
.... and the ACE'95 Grand Prize!

=-=-=-=-=-=-
MIDI, DTP, Wordprocessing, Graphics, Power Computing, Software
Libraries, Utilities, Accessories, Databases, Spreadsheets,
Custom Solutions, Games, Educational, Internet, BBS, Networks,
Accelerators, Emulators, JAGUAR Stations, User Grop Center,
INCREDIBLE SALE PRICES, Software, Hardware, and EVERYTHING you
need to get the VERY BEST out of your Atari!

=-=-=-=-=-=-
More Atari users in one place than is EVER safe =;^) (or sane!)

==========
Getting to ACE'95 is *easy*. Toronto is drtly
accessed by Highway 401 or the Queen Elizabeth Way,
or Highway 400/69. Crossing the US/Canada border
at Detroit, Buffalo, Niagara Falls, Ft. Erie,
Ogdensburg, Kingston, etc., will lead you directly
to Highway 401 or the Queen Elizabeth Way. Take the
Yonge St. Ramp north off the 401 and drive to 5110
Yonge St. If you take e Queen Elizabeth Way,

Hi Martin,

> Does anyone know where I can FTP a synth editor or a librarian for
> the Kawai K4 to use on the Atari ST?

I know that Carl Lofgren has written some stuff for the K4. Ask him to
send it to you! His email address is: <m9174@abc.se>.

Say hello from me, will you?

Yours sincerely

-Sven-

Very interesting that Motorola only made a prototype of the 68060 and never published any information on it, so finding a Medusa with that processor in it could be very hard.

My mate owned an Amiga and has just bought a 486 dx2 66 with 16 bit soundblaster. He had to buy the soundblaster because and I quote 'The sound onthe pc is crap with out one'. Fair enough. However the ST has twice the channels of sound that the Amiga had and the same capabilities and is the industry standard machine for Midi. How much for a new (Yes they are still selling everywhere) STe? Price about 200 pounds. How much for a 16 bit sound card with Midi on a PC, price about 200 pounds.

Now, I myself would rather spend 200 quid on a machine not a crappy card. I agree the pc is better at graphics, but how much does a decent one cost. Price, about 1500 pounds. (full spec dx2 66).
As far as wordprocessors go the ST has some of the best around, againg the pc has a better interface for these and is more powerful but, isn't it the output quailty that people look at? Using the same printer I bet people wouldn't be able to tell the difference between an atari doc and a pc doc.
I'll stick with my ST thanks.

Some of us just don't have that sort of money to buy a crappy standard machine made to the spec of a company who holds the monopoly on computer operating systems.

From Ray.

Use Backwards....

Best compatibility mode, but change the RAM to 1 meg. It does work with the 030 at 16Mhz as well.

I found a couple of times that it hangs at level 7, but other times I have got much further... My joystick broke on level 68 ish.... (with droid)

Anthony

BTW, on sat. I passed Continual Hassle!!! and then lost my remaining 17 lives on Meet your Nemesis.... (llamazap)

So - it seems one of my "friends" has got into my account and is trying to get me into trouble with lots of people - nice :(

Anyway, I've now changed my password so this shouldn't happen again...

Just for the record : I used to own an ST and I wrote demos on it. Yes, I can appreciate how good the coders were - and that they didn't need custom chips like the Amiga!

So please! Don't send me any more mail - I'm already getting s*** loads from all the other newsgroups that "I" have insulted!!!!

Bye for now,
respect.

Ian.

You've probably never done this! This is nice as an experiment, but
it takes ages before everything is finally there in your Xserver. I
believe somethings of about a minute or so on a 14k4! And then only
program has started! Think of images!

Gerco.

I completely agree with this. Yesterday evening I started a simple Xclock
on my atar Xterminal, and it took ages and ages. (ok, I am running on 2400
baud), but 14k4 is too slow for running applications like netscape/mosaic
remote.

|> less than it was say 2 years ago. Btw, do atari still make the ST/STE?

True, the ST market is _less_ than it was, but is NOT dead - take the news STE
only
games....

I believe that Atari said that if they got an order of sufficient size, they
would
manufacture ST's...

|> >|> So why bother - get a PC... It beats the ST in every way. It is
|> incredible
|> >|> that
|> >

|> Basically, you get better than ST performance, but at a (very) high price.

But your not comparing like with like here.... You cannot compare a 1985
machine
(the ST) with a 1994 machine (the Pentium). Compare it with an 8086 based
machine...

If you want to compare against 486/Pentiums look at TT / Falcon / Medusa etc.
The
Falcons sound output pisses over the AWE without any addons....

|> >|> people still insist the machine is very much alive. Atari just don't
|> know
|> >|> how to
|> >
|> >Why ? 'cos it does what they want it to, without the need for crappy

|> and no harddisk.

But why? because the OS takes up so much, and you can only use the bottom 640k
of
RAM anyway... (I'm assuming we're talking DOS/Windows here.)

PC software houses dont seem to have grasped the concept of compression....

|> Basically, for the ST to succeed, Atari need to make a good, decently

J S W Chan (ma2jswc@bath.ac.uk) wrote:
: less than it was say 2 years ago. Btw, do atari still make the ST/STE?

That's like saying, do IBM and the clone manufacturers make 286s. Stop
comparing the Pentium or a 486 to an ST.

Compare a pentium to a medus or an Eagle.

: And it is true that the PC beats the ST in everyway, it just depends on
Nope. Don't agree.

The PC definitely does not beat the ST, for fun....and i do not mean games.

I work with all sorts of computers in my job....and my fave is the
Atari platform...esp the Falcon.

The 8mb 386 I have on my desk here is even slower than my 4Mb STE at
home....let alone the Falcon sitting right next to it.

: But 8Megs is standard on a PC these days, and they do run faster than an
: ST equivalent. (Well you'd bloody hope so anyway). ST programs don't need
: xxx megs RAM or Harddisk, because the user base has on average 1 Meg RAM,
: and no harddisk.

Again, comparing a Pentium to an old ST. Don't do it. Look at the
average Falcon User. I bet they have a min of 4 Megs, and a hard disk.

: Basically, for the ST to succeed, Atari need to make a good, decently
: priced, ST compatible 68040 computer, which people will hear about. The

Another one to go on about compatabilities.....why? No wonder the
coputer industry is not progressing the way it should. We need to move
away from CISC...

It is nice to have compatability, but if we move onto RISC, or even
parallel computing....poerful processors, then I am sure compatability
would not be a problem, as you can then fairly easily emulate the
older computer.

I am sick of the 80x86 line...they only seem to go faster...and that
is it. No change at all.

: move... Where's Atari's version?

Seeing the size of the company.....and seeing the foreseeable future
of Power PCs, it will be a bad move. Maybe they are waiting for PREP.

: I think Atari lack marketing of any kind, and are relying too much on
: income from patents on 9 pin joystick ports :-)

No, I think they are relying on sales of the jag ATM.

>Joshua Scholar (jscholar@ccnet.com)

I can't see what you are trying to do, you just place all those files
in a folder then copy the folder contents....

A RAM disk can behave the same as a floppy so you end up with the same problem,
, can't you use a Modem link..??

Note, the base page only holds 112 Directories, unless you format it with some
thing else like HyperFormat, so I can't see you putting 1,000 files on these
disks....

So Please explain what you are trying to do then we can help you...??

Does anyone have a list of programs (and games) that doesn't work with TOS 2.06? I have an STE with TOS 1.6, have just ordered TOS 2.06 and would like to know which programs will fail to work...

Plug your Genious Mouse in the serial port of your Atari, and get a driver,
like Mousetricks. I know there are some PD programs that'll let you do this
too, but I can't remember which ones.

2583. Re: CoNnect, wherefore art thou?

Newsgroup: comp.sys.atari.st
Date: 1995-02-20 12:43:41 UTC
From: wwc@axher6.desy.de
Message-ID: <WWC.95Feb20134341@axher6.desy.de>
Source record: 171221

On 25 October 1994, I sent a money order for $50.00 to Michael
Baffoni, the North America contact for CoNnect registrations.
It is now four months later. I have received neither key, nor
reply, nor a return of my money order.

If either Michael Baffoni or Wolfgang Wander, the author, have
any idea what has happened, please let me know. For the record,
I am not here accusing (or even suspecting) anyone of shady
dealings, but am rather hoping to hear there was a mixup and that
my key and manual will be on their way to me soon.

I've been putting this inquiry off for several months, as I have no
e-mail address for either Michael or Wolfgang. However, I'm getting
a bit tired of reinstalling and reinstalling and reinstalling this
GREAT program, and after four months, feel that this is more than a
simple case of snail-mail delay.

Hallo John,

first of all - my and Mikes E mail adress is in CoNnects online help.
I will investigate this process and try to find out where the order
is hanging. I hope to make you satisfied soon.

Wolfgang

No, although a couple of people were working on one.

> I have tried out a program for a PC which fools the UNIX host to think it's
> a SLIP account that's being used. It's called "Winsocket" or something,

No, winsock is a socket interface, like MiNTnet. You have to install a program such as TIA on the unix system to make it behave like a SLIP account, and then run normal networking software on the PC/mac/atari/whatever.

> We have TIA installed on the UNIX system I'm connected to (modem connection)
> so, can I use this with my STE? How?

Yes, using MiNTnet, or probably also with Demon's NOS package. Neither of these have a graphical web browser yet, although MiNTnet does have a text based one, lynx.

By the way, is it just in the UK that almost all internet providers only offer SLIP accounts, and not login ones?

Just for the record, I can usually tell a Word-for-Windoze printout from the output of TeX or Signum! Sadly, Signum2 doesn't quite beat WinWord, but Signum3 certainly does - not only in output quality. Working on a 33MHz 486DX WinWord is about as fast as Signum3 on a 16MHz MegaSTE (68000 !) - where does all that 486 computing power go?

(No Signum3 advocacy meant here, I just happen to have worked with both programs.)

2587. A few queries (mostly MiNTOS/MiNTnet)

Newsgroup: comp.sys.atari.st
Date: 1995-02-20 13:59:57 UTC
From: mnb20@cam.ac.uk
Message-ID: <m0rgYb9-0005tqC@black.csi.cam.ac.uk>
Source record: 171223

1) This is easy for anyone that's used a Unix system: how do I set passwords?

2) I can't get ftpd to work (not that I really need it anyway), when I type a valid login at the prompt it asks me for a password even though there isn't one defined; if I log in as ftp or anonymous it asks me for my email address as the password, as it should do, but then says it can't set guest privelidges.

3) If I try to nfs-mount anything it appears in the /nfs directory as just a file, not a directory. It gives an error if I try to cd to it or even just do
ls -l in the /nfs directory.

4) Can I set it up so if I log in as a particular user it starts GEM. I don't think so as it seems to need to be root - actually what I've done now is have a user called 'root' that is a wheel but not actually the root, and the real root user is called 'gem' and does load gem. But I'd rather not do it that way.

5) NVDI 3 doesn't seem to work now, it says it can't find off-screen drivers and then hangs.

2592. Re: Does Warp 9 work on the Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-02-20 14:37:06 UTC
From: alfasoldt@aol.com
Message-ID: <3ia9ei$i64@newsbf02.news.aol.com>
Source record: 171228

The latest version of Warp 9 includes a Falcon-specific executable. This trash about CodeHead's support is just that, BTW. It's actual support has been outstanding.

NVDI 3.x provides more of a "snap" to overall screen redrawing. It tests out faster, but the main drawback of NVDI is the way it handles scrolling. It's possible (if you try hard enough) to see color smearing on any color system. Warp 9 is designed NOT to do that, and that's one reason it is slower than NVDI.

I own and use both (but not at the same time <g>).

Al Fasoldt, Systems Editor, Syracuse Newspapers

:
:That's like saying, do IBM and the clone manufacturers make 286s. Stop
:comparing the Pentium or a 486 to an ST.
:
:Compare a pentium to a medus or an Eagle.

well the marketshare of the medus + eagle (does the eagle actuallly exist???)
is about 0%, so that comparison is in some sense worse than the
comparison st <-> pentium. But of course the comparion wrt to speed/etc is
better, indeed.

:
:: And it is true that the PC beats the ST in everyway, it just depends on
:Nope. Don't agree.
:
:The PC definitely does not beat the ST, for fun....and i do not mean games.

what OS are you using?

:
:I work with all sorts of computers in my job....and my fave is the
:Atari platform...esp the Falcon.
:
:The 8mb 386 I have on my desk here is even slower than my 4Mb STE at
:home....let alone the Falcon sitting right next to it.

what OS are you using?

:
:: But 8Megs is standard on a PC these days, and they do run faster than an
:: ST equivalent. (Well you'd bloody hope so anyway). ST programs don't need
:: xxx megs RAM or Harddisk, because the user base has on average 1 Meg RAM,
:: and no harddisk.
:
:Again, comparing a Pentium to an old ST. Don't do it. Look at the
:average Falcon User. I bet they have a min of 4 Megs, and a hard disk.

true.

:
:: Basically, for the ST to succeed, Atari need to make a good, decently
:: priced, ST compatible 68040 computer, which people will hear about. The
:

:Another one to go on about compatabilities.....why? No wonder the
:coputer industry is not progressing the way it should. We need to move
:away from CISC...

maybe

:
:It is nice to have compatability, but if we move onto RISC, or even
:parallel computing....poerful processors, then I am sure compatability
:would not be a problem, as you can then fairly easily emulate the
:older computer.
:
:I am sick of the 80x86 line...they only seem to go faster...and that
:is it. No change at all.
:
:: move... Where's Atari's version?
:
:Seeing the size of the company.....and seeing the foreseeable future
:of Power PCs, it will be a bad move. Maybe they are waiting for PREP.
:
:: I think Atari lack marketing of any kind, and are relying too much on
:: income from patents on 9 pin joystick ports :-)
:
:No, I think they are relying on sales of the jag ATM.

relying on sales of the jag is a certainly a lack of understanding of the
market.

:
:Danny

I found it out already. It's `just a bit' kludgy, don't you think?
As a matter of fact, since TOS and MS-DOS filesystems are compatible
anyway, it would've been much simpler if direct access to HD was
possible. Now communication between DOS and TOS still has to go via
floppies. Shame.

>>And on legal terms, if I FORMAT /S a floppy on someone else's PC, can
>>I use that as bootdisk at home?

>If you insist on using SoftPC, that's the least of you worries....
>(old DOS5 disc sets approx 5.00 (UK), SoftPC on other platforms, 20 times
>that price or more, lawsuits, etc).
>(I must point out that I do not condone the use of pirate versions of softPC)

Look, I got SoftPC as a free PD diskette when I subscribed to Atari ST
Nieuws, a Dutch Atari mag. They openly advertize it in their mag (and
it was my main reason for subscribing) so I gues they know what
they're doing. It was taken off the MAUSnet. I didn't buy it from
some dealer in a back alley or something, nor copied it from someone
else, nor let someone else copy it from me. It's mainly on my
harddisk for `cheching it out'; if I find myself heavily using it,
I'll probably get myself a FalconSpeed or something. Or a second hand
`real' PC.

Regards,

That's because the PowerMac only emuluates the 68EC020 processor without PMMU, and MagicMac requires a PMMU to work.

Hmmh Chris,

I'm a little confused ATM, you're both saying the same, aren't you? Take a look:

------------------------------cuthereplease------------------------------
MiNT

If DRVIN and the drivers are started before MiNT only a little of the functions will remain. That's why DRVIN and the drivers should be started after MiNT. In this case all functions are realized as under TOS, but no more. Redirections and sleep and other plays are impossible with this file handles. I don't know whether the AUX-device switching for the aktual process will continuosly work. I use neither MiNT nor MultiTOS. As long as no MiNT freak is to be found who takes over the adaption and support, no special versions for MiNT will exist.

------------------------------cuthereplease------------------------------

However, s. o. on a German newsgroup said to start HSM _before_ MiNT. But your mileage may vary ...

That's not quite true; I'm typing this on pc2042.nmus.pwf.cam.ac.uk but the domain name is just cam.ac.uk. This is so to use another local machine you don't need the full address, eg I just type 'telnet hermes' to read my email.

I have been looking into this myself...
I just spoke with George Geczy, the author of Hyperlink for Atari computers. It is a Hypertext development system which supports Dbase files, IMG, text fields, buttons, icons, etc... It is not specifically for HTML, although, it is conceivable that it could be re-written or patched to serve this purpose. Aside from the translation, it would also have to be taught to telecommunicate.
In any case, much of the work has already been done, and the Author is willing to sell the code (cheap) if there is another developer interested in continuing his work, and/or adapting Hyperlink for HTML.
He can be reached at
george@jmg.on.ca

I would certainly be willing to contribute in any way possible. I haven't don't much serious programming lately, so I'm not up to speed - but that never stopped me before. The advantage to using something like HyperLink is that it is modular so that we can add modules to support each data type (sound files, images, animations, etc...). It may even be possible to use Hyperlink modules to launch other existing media players (GemView, various image and sound TTPs, etc...).

>bass-boost removed)- I don't want to do graphics work or anything particularly
>random-access-intensive with it. For my purposes would I be better off
>getting an audio-orientated CD player instead?

You should check with the advertisers that the are offering the same item, eg.
is the 100 UKP drive internal non SCSI, whereas the 200 UKP is external, or
includes software and/or a Falcon cable.

The CD300e has a SCSI interface, which is what you want with the Falcon.

You can play audio CDs on the CD300e with suitable software, eg Extendos Pro,
Egon.

] I can see several reasons that the Atari entertainment market has
] dwindled so significantly. To begin with, Atarians have been the piracy
] scapegoats since the 8-bit days. Lots of companies wouldn't do Atari
] games simply because of the bogus reputation. This also led to a horrific

Yeah right, like EVERY other computer platform didn't have just as much,
or probably MORE piracy! Look at the amount of piracy on the PC, even
considering the larger base, the proportion is still higher than it ever
was on the Atari. The simple reason companies have stopped producing for
the Atari is that the profit made from such a tiny user-base compared
to the Mac and PC isn't worty bothering with.

Frequently Asked Questions (FAQ)
comp.sys.m68k

[...]

D) CPU Clocks and Double-Clocking

CPU clock speeds are used by consumers to compare the performance of
different microprocessors. This is the classic case of comparing apples
and oranges in almost all cases. Clock speeds can only be used for comparison
with the same processor and then with care.

For example, a 1 Mhz MC6800 processor runs at the same bus speed as a 4
Mhz MC6802: the 6802 has a divide-by-4 circuit so less expensive 4 Mhz
crystals can be used. This is also a cheap way to make a CPU seem more powerful
but runs the risk of marketing "numbers games". It is better to compare CPUs
with test programs that return comparison values such as "millions of
instructions per second (MIPS) or Dhrystones. Even then, one must be very
careful using such comparisons - see Cray under "F) Speed Comparisons".
Motorola clock frequencies should not be directly compared with other
manufacturer's frequencies.

The effective speed of a processor depends not only on clock speeds but
also on computer bus speed (ie memory speed), CPU registers, internal features
(such as caches), FPU units, external features such as external caches and
data bus width and the software used. An instruction and/or data cache
usually dramatically improves system speed. A 25 Mhz part is not
necessarily twice the speed of a 12.5 Mhz part since system speed also
depends on the external resources the CPU is connected to.

The issue of "clock-doubling" with Apple products and the 68040 is a
question often asked on the net. Apple (and others) advertises some of
its notebook computers with "33/66 or 25/50" Mhz speed designations. This has
been referred to as "clock doubling". The '040 has two clock inputs -
PCLK and BCLK. PCLK runs at twice the frequency of BCLK. BCLK (1/2 PCLK) runs
at the frequency of the part and is used to derive all bus signal timing.
PCLK (2x BCLK) is used for internal logic timing. PCLK is not present on
the 3.3 volt parts (MC68040V and 68EC040V). The 68020/030/060 do not have
this feature but the 68360 does. Use BCLK as the part's true speed.

This is not the same as Intel's "clock doubling" on the 486 Overdrive
chip. "Overclocking" refers to increasing a CPU's clock frequency beyond the
part's specification for higher performance (also called clock-chipping).
Sonnet's "clock doubling" or "booster" chips (for Macs) interface a slower
system bus to a higher speed processor that has internal fast caches.
[...]
----------cuthereplease----------

The second-last paragraph say everything, doesn't it Kim?

Furthermore I posted a request in comp.sys.68k (Moto-folks do read there).
I'll let ya know ;-)

Simon: You could use Ghostlink.prg to "control" (heh, heh, heh) your IBM from
your Atari. Need a serial cable with null modem and Ghostlink. Run IBM part of
the program first, and setup for the correct com port, and baud rate, then run
Ghostlink on your Atari, and set up also, click ok, and add the extra "IBM"
DOS disks to your desktop. Click on the "new" drives and stand back!

> do the 68030 and TOS 2.06 roms cost at this time...?

No - as the 68000 and 68030 have different pin outs - and just plain
different signals in some cases.

It can be done. The PAK3 is a board which takes a 68030 and TOS 3.06. This
make a ST quite TT like - though of course you don't get the TTs extra
hardware.

In fact a PAK3 can be faster than a TT, but they are not cheap.

Roland.

> hd's,modems, etc ?

You might be interested in Ghostlink - the following is from the doc file:

Ghostlink v1.02 Beta 02/05/94

What is ghostlink:

Ghostlink is a link between an Atari GEM Computer (Master)
and a MS-DOS computer (Slave)
It allows the drives (floppy, harddisk, CD-ROM) installed
on the slave to be used by the master as a GEM-partition.
It is possible to connect up to 3 PC slaves (on different ports!)

So, you can, for instance, import a picture stored on a CD-Rom
(connected to a MS-DOS PC) into Calamus!

Although I have it here I haven't yet tried it - I need the lead between the PC & TT030!

Hope it helps!

From: simon@bassland.demon.co.uk
Message-ID: <793335302snz@bassland.demon.co.uk>
Source record: 171141

Just for everybodies information, my ST runs a lot quicker than my Mac. Both have the same clock speed, and processor.

I bought a Falcon, because I wanted decent graphics, and sound, and reasonable amount of processing power. Yes, a Mac Performer 475, would have been the same price, with the same processor, and with a monitor, and running at 32Mhz, instead of a snail-slow 16Mhz. But I don't like the noddy-feel to the Mac OS. TOS is much nicer <:-)

BTW: My dad has a PowerMac 6100 (bottom of PMAC range), but I have yet to see it :(

If I had to upgrade from my Falcon, it would be a PowerMac though. If I had to upgrade from that (winning National Lottery dependant), I would get a SUN workstation probably. I WILL NOT GET A PC....so there.

Erm, anyway.....goodbye.

>However the ST has twice the channels of sound that the Amiga had..

Umm.. excuse me.. did I miss something here..? My ST has *3* voices.
My STe has *2* output channels... the Amiga has always had FAR better sound.

>How much for a 16 bit sound card with Midi on a PC, price about 200 pounds.

Err.. price for a 16 bit SoundBlaster (THE standard soundcard) with Midi..
$95.00 (dunno how much that is in pounds, but certainly not 200).

The ST has some nice things about it, but the PC being "crappy" isn't one
of them.

Well, if I remember correctly, the Atari patch(es) have been available for a much longer time than the Amiga version (2.2 came out on Atari first). That could account for it. What are the dates of each of those files? Hmmm.

Regardless, Soft-Logik had already committed to the Amiga new version. From what I've heard in recent months, the Amiga version was selling much better than the Atari version could dream of - hence SL's further commitments to it, and lack of an Atari commitment. It all boils down to sales. How many new copies of Pagestream do you think Soft-Logik could sell today? Not upgrades, _new_ packages. Very few, I'd surmise.

RJ> interface years ago with some PC software based on it, and I liked
RJ> this interface quite a bit and was always disappointed that it never
RJ> caught on with PC software. Now my home computer is almost dead and
RJ> used ST's seem to be pretty cheap.

Sure it is the main reason I stick with Atari's despite it being very unfashionable. If you liked the GEM interface on your PC you will adore it on an Atari as it is a much better implimentation of it (especially if you get a machine with *at least* TOS 2.06 in it. (Upgraded ST or one of the newer models MegaSTE,TT,Falcon).

Novell bought out Digital research recently and for a moment I thought we might see something done with GEM in the mainstream PC world but AFAIK they have done nothing with it and neither do they intend to :-(The only recently supported GEM package that I knew of on the PC is Ventura Publisher but without any upgrades to GEM it has died despite being at the time the most highly rated version (2 or 3 years ago) by many PC mags abd DTP users.

From: Spencer.Davies@mettav.exnet.com
Message-ID: <793679276.0@mettav.exnet>
Source record: 171147

Out of the ether, the following was uttered by Richard......

RJ> Listen pal, the PC has only syurvived because IBM bailed out
RJ> corporate america when CP/M failed and they have had it ever sense.
RJ> IBM failed when they designed a system with zero expansion capability
RJ> and locked in a design that was sure to be outdated.
Not true. IBM wanted a piece of the small computing market and the only reason that they didn't choose CPM over DOS was that the MD of Digital Research was a plane nut and would rather fly his plane than talk business with IBM!

Also, I wouldn't say the PC has zero expansion ability, for the late 70's early 80's it wasn't too bad. But it never kept pace development wise and has become a legacy system like the mainframes/mini's it aimed to replace.

RJ> You will find that IBM is trying to change that with their PowerPC
RJ> line to REPLACE the far outdate MSDOS/WindoZe line. Frankly, you
They really want to grab the market lead back from the likes of Microsoft/Intel who stole it from them early on, and they have never succeeded in regaining it!

They will offer you a powerful modern system, with the IBM name behind it and other big name backing in the hope of taking on Microsoft/Intel and winning this time around.

RJ> couldn't pay me enough to get a MSDOS/WindoZe computer. I would much
RJ> rather get a PowerMAC with a design that was always intended to be
RJ> expanded and not patched around and limited. The macintoshes are
I'll give your PowerMac 3-5 years before it is declared old and well passed it. Remember the big problems people suffered when Apple upgraded System 6 to 7!!!

Also this market relies on quick turnover of goods, both software and hardware. A static market is good for no one. I believe the current market life of a PC (personnal computer!) is something in the region of 10 months though those selling us it would like it to be less!!!

RJ> very similar to the ST's with expandability and the capability to use
RJ> just about any display, bus, and device connection. The hardware is
RJ> designed for the vast variety of peripherals of the future.
The ST is not expandable! Its has just been successfully hacked around. I would class a truly expandable system as being one which allows the CPU to be replaced just by slotting in a new card in a pre-designed slot, an enhanced high speed display available just by slotting in another card and none of these changes causing software to break.

Ok, so I live in cloud cuckoo land!!!!

RJ> I happen to have a 2.5 megabyte ST and a 16 megabyte PowerMAC that
RJ> blows you DOS box out of the water in performance and speed. Heck,
But alas the ST has no market when compared to the PC, but I would buy a
PowerMac tomorrow if I could run a Unix system and get cheap software for it!

RJ> my powerMAC can run WindoZe in a window while I run mac programs in
RJ> others. All at a speed equal or better than a 33 MHZ 486. There's
Not bad, but who wants Windows when you can have Finder?

RJ> not design limitation for expansion. I can add SCSI devices, I can
RJ> add LINEAR CONVENTIONAL MEMORY on board to 72 megabytes and no
RJ> special drivers are required. I can actually click on a drive right
Hmmmm, so can I if I use OS/2. DOS is a dog, agreed!

RJ> on my desktop and use things. I do not have to go to a special "File
So can I with Warp on my PC.

RJ> Manager" and install special icons and tell the Program Manager I
RJ> have another program just so I can use it.
You do have to install your Mac apps though, and copy your Extensions to the
relevant folder and hope they don't clash with anything.

RJ> Just because lots of people buy DOS boxes doesn't mean it is the
RJ> best available. Frankly, Atari is not the best available, but it is
RJ> much better than a jury-rigged DOS box regardless of the CPU
Agreed. There is currently no ideal computer in my eyes. I love my Falcon for
its ease of use and the knowledge I have of it, but use my PC for the software
I need, like Tie Fighter ;->

RJ> installed. It's not the processor that makes the computer. It's the
RJ> design of the computer. A 90MHz Pentium system is just like a blower
RJ> in a Yugo. When all is said and done it's still a Yugo.
Agreed. Intel 80x86 chips are not the best in the world. They weren't to bad
when deisgned but have now a great deal of baggage to carry around as their
selling point is the compatibility.

RJ> drivers, extended and expanded memory, bogus IRQ port settings, and
RJ> segmented memory accesses and you can have a great computer. Right
RJ> now they are pushing maximum density. Raw speed still can't cover up
RJ> poor design.
Get rid of the compatability which has sold PC's to date and you have a
different machine with no software, no market!

RJ> Apple and Atari have the better design period. Atari hasn't built
RJ> upon it and that's their fault, but Apple has and have some great
RJ> computers that are fast and up to date. If Atari would just take
RJ> Apple's lead, then they can also have one very serious modern
RJ> computer. An Atari PPC would be a nice system, but oh well...
Apple has also managed some issues pretty poorly. They could have ruled the
world but choose instead to aim for high profitability and low market share.

RJ> Get a life pal.
A life, whats that? ;->

>*greatly* appreciated. Thanks!
> ---> Please respond to the e-mail address below

If you can spare the cash upfront, then $89 will buy you Ratsoft ST, probably the best atari system available currently, on the shareware and public domain side it might be worthwhile checking out Octopus (multitasking).

A few "lesser" (known!) bbs systems I've ran are Triplink, excellent but no longer supported by the original author (although development is still being conducted and a namechange is in the works) and Total Logic (BRILLIANT but I don't think it ever made it past beta version before the author moved on)...

..a bright note is the forthcoming ForeSight BBS package which looks great, and is due for release in the next 1-2 months...

Hope that helps... Andy

HM> doing a picture in broadcast resolution (768 x 576, 24 bit), with AA,
HM> in a reasonable
HM> time. Not to mention a whole 2D-animation.

It is clear by this statement you have either never seen Apex and thus are merely conjecturing from a position of ignorance or you were not able to use it properly !

Can you tell me of a machine and software that will (at under 30,000UKP or $ or even DM) do the above in a "reasonable time " what ever you define this to be. Apex cost under 1000 pounds including Falcon !!! and is faster than any other machine/software combimation at three times the price !

HM> Linux, NT, OS/2, NeXT provide so many more features than MagiC. It is
HM> hard to compare it to anything on other platforms.

WEll I know I can compare price and memory useage and Magic wins this by about 800% and 16000%<G> respectively.

HM> Could be. I'd still never buy a Falcon. In hi-colour modes, the speed
HM> is really bad.

Haha ,then what do you describe a PC even with a VLB card in hi-colour mode ..! Hi colour is not merely slow but on a standard 8meg PC is unuseable under windows due either to running out of memory or the GDI resources bug.

SK+Does anyone know the best way to connect a Atari 520 STfm and a PC 286 so th
+I can transfer files from one to the other ?

Try GHOSTLINK,(shareware)It contains two programs.
One Master prog for your St and one Slave prog for your Pc
Connect the computers together though the seriell ports
and off you go.You can access all drives on your Pc
through your ST(Just install the icons needed,
and double click them on the desktop)Files can be copied
moved,deleted as usual.

When it comes to speed ,i'm not sure what speeds thats possible
on a St.On my Falcon i get sppeds upto 115000,but i think
38400 is possible on a St if you use HSMOD6

I've got a beta version of Ghostlink,does anybody know if
it has been updated ?

Sten.

2672. Magic & TOS errors

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 08:03:30 UTC
From: Rod@ivecoft.demon.co.uk
Message-ID: <793353810snz@ivecoft.demon.co.uk>
Source record: 171054

Can anybody please tell me what TOS error 69 is. I'm trying to run several programs using MagiC and they come up with this err. One of the progs is UVK and Niall Mc' has been informed but as yet hasn't got back to me.

Is there anything I can do? Putting MagiC into tos compatibity has no effect

TIA

>
> As I recall, the latest version of Warp 9 does indeed work with the
> Falcon. However, I am certain it does not work in truecolor, and am
> uncertain if it works in modes greater than 16 colors, which would
> also leave out the popular 256 color modes.

Warp 9 certainly works fine with the Falcon! I used it for six months without
any problems. All video modes supported.

> I have noted that NVDI seems to be the screen accelerator of choice
> for Falcon owners. It does have the advantage of being actively
> supported.

Plus the fact that ScreenBlaster plays ball with Cubase Audio - something
Warp 9 won't do, hence my switch to NVDI.

I still miss Warp 9 though. In my opinion it is slightly quicker/better during
certain circumstances, but admittedly, the differences are small.

> It recently was updated, while Codehead has essentially stated to
> expect no further updates of their programs, due to the current state

ST-Guide can import .IMG files (not sure about colour ones) using the
@image operator.

>Just out of interest, how many levels of indent do you think it
>should be able to cope with? Say every indent takes up 5 chars, I
>could have about 20... Sound good?

What sort of indents do you mean? kind of thing?
You could make every heading tag form the start of a new node.

I haven't seen the bit in ST-Format about web browsers, but beings as I know who writes the comms stuff for Format (hi Frank) I assume they were reffering to ZFC's GEM based browser (I don't think it's got very far yet) and the port of the Unix Chimera browser to MiNT-X which I am doing.

This was going fairly well, but I am now waiting on the new baserel Xlibs release 'coz one of lib files is missing from the current distribution.

Expect to see this in the near future.....

Craig.

Are you sure about that? I understood that, in your case, cam.ac.uk would be
the hostname, and domains would come before that in the address.
However the point is a little academic; I was referring to the definitions
within the KA9Q docs and scripts as a specific application; that's how THEY
see them.

thanks anyway

He doesn't need to. That was a legitimate quotation - or don't you
understand the normal use of quotation marks (why do you think they are
called that) in English? It was referred, too, so you can't complain about
infringement either - though I daresay you will!

Bloody colonials; never did learn their place.

>(at least I assume it's xterm) which I can't move. And I can't figure out
>how to run an extra xterm in a diff window on a different place on the
>screen.
>

You need to have twm run as the last thing in your .xinitrc file in your home
directory.

Example .xinitrc

```
# Fix the keymap for QWERTY
xvt -ls /usr/local/bin/X11/xmodmap /etc/ukXkbd.map
# Run a shell to be ready for commands.
xvt -ls -n Craig1 /bin/sh &
# Run TWM to manage the windows.
twm
```

You also need a .twmrc file in your home directory to configure twm to how
you like it.

Craig.

|> twice the channels of sound that the Amiga had and the same capabilities
^^

Wrong ! The STFM has one channel (mono) and three _voices_. The STE also
has two channels like the Amoeba (stereo L&R), but in addition two extra voices
from the DACs, which are in software programmable to play as many voices as
you like up to a limit (because they're digital and has a finite resolution).
The Amoeba games machine has FOUR independent DACs, two per channel, and
also FOUR voices of sythesized sound.

|> and is the industry standard machine for Midi. How much for a new (Yes
|> they are still selling everywhere) STe? Price about 200 pounds. How much

They are not _everywhere_ because my friend wanted one and all the dealers
who advertised them didn't actually have any stock. Luckily I found him
a stonking good second hand deal :)

|> for a 16 bit sound card with Midi on a PC, price about 200 pounds.

: >|> Nearly everyone on the planet knows that the ST is dead. It has been for 2
: >|> years.
: >
: >Really ? Mine works fine.

: So did mine, but I sold it. You must admit, the ST market is slightly
: less than it was say 2 years ago. Btw, do atari still make the ST/STE?

: And it is true that the PC beats the ST in everyway, it just depends on
: what parts you bolt onto it. An AWE soundcard will piss over the ST/E
: sound output, but you do pay for the privilage (200quid! > than an ST!)
: Basically, you get better than ST performance, but at a (very) high price.

Well, there is one thing that the ST will always beat the
IBM/clones in....ease of use...how many people do you know besides actual
programmers know how to use their IBM that well?

: Basically, for the ST to succeed, Atari need to make a good, decently
: priced, ST compatible 68040 computer, which people will hear about. The
: Falcon was not the solution, nor the TT. They PowerPC seems like a good
: move... Where's Atari's version?
: I think Atari lack marketing of any kind, and are relying too much on
: income from patents on 9 pin joystick ports :-)

I think that Atari should get off their duffs and do something
with the hardware in the Jaguar...forget using a 68040, why not use a
RISC chip, they're cheaper from what I hear anways...

>Get a life - get a PC :)

Unless you run a UNIX on it, you'll have no life. You'll spend all your
time messing with stupid text-based configuration files trying to get a
stable system or squeeze a few k of RAM out of that massive 640k area.

Add in a new card (after having listened to all the people spouting
about how "expandible" PCs are) and it's back to square one, with extra
crap added in, like figuring out which IRQs are free, what memory
addresses aren't used, etc.

PCs are *expensive* game machines. Spend $100 Cdn on a used Sega or
something instead and buy a _usable_ computer.

A whole stack of Dr T's for sale!

KCS Omega LEvel II, with Tiger, Quick Score and Song Editor, and PVG,
for algorithmic composition. It includes KCS 3.0.
I also have previous versions of KCS
XoR universal Librarian/editor, with a fair amount of profiles, including
some of the MOTU profiles they wrote for it.
Copyist notation software - multiple versions
all docs and discs.

This is all for the Atari ST

Make me an offer if you are interested. I'm not shipping out of the
country...too much hassle.

No, that's quite true, if you have an o/s more than about six years old it
won't work. But it's time you upgraded anyway.

The original problem was due to the use of some instructions which on the
'030 are supervisor mode only.

Sounds like you didn't save as ASCII !! Make sure that First Word + is not set to "Word Processor" mode (IIRC - the one that if not set wont let you use word-wrap) and then save the file.

To check that it has saved correctly, double clicking on the document from desktop should display it correctly....

This should work fine, although you will loose all BOLD and UNDERLINE etc.

HM> The second-last paragraph say everything, doesn't it Kim?

It sure does Hendrik, and i agree with you based on the above the 68040 is
not clock doubbled the same way as an Intel. But i havn't said it was. I only
said it is doubble clocked, nothing else.
I spoke to one of my friends who has some technical knowing as well, and
he said exactly the same as the above.

I don't know who has won the bet, as it seems to me i'm right since part
of the CPU is doubble clocked.
The question is, is it wrong to state the 68040 is doubble clocked because
it's in a different way of an Intel, (cause thats really what you tell me?).

2712. Re: Composite Video from ST

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 15:52:29 UTC
From: limchung@iscs.nus.sg
Message-ID: <3id27t$6c9@nuscc.nus.sg>
Source record: 171193

Hi guys, thanks for all the replies. I've checked up an Atari book and it says that pin 2 on the STF is not used. So I will look in the direction of getting an Amiga modulator. Thanks again.

2713. ST Emulator for the IBM?

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 15:55:53 UTC
From: al215@FreeNet.Carleton.CA
Message-ID: <D4CxL5.BoJ@freenet.carleton.ca>
Source record: 171004

I thought I heard someone say there is an Atari ST emulator for the IBM?
If this is true, could someone tell me what FTP site (maybe UMICH?) it is
on, and what the filename is? Thanks

2714. Convert Atari->Mac

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 16:00:41 UTC
From: p.vass@magnet.at
Message-ID: <1704062974.969515@magnet.at>
Source record: 171077

Hi!

Please who could help me? I have problems to open some Atari-formatted disks with my Mac. I m using the Atari as well as the Mac for sequencing.
It works with my one Atari but it s a 1040 mega ST F FM E , cause I did a lot of tuning. I think the problems are the different TOS s.

Greetings and thank you,

Paul.

2715. PAM's Ethernet and TU-Wien-Soft

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 16:01:39 UTC
From: gd63@vision.hrz.uni-giessen.de
Message-ID: <D4Cxus.IJM@muster.hrz.uni-giessen.de>
Source record: 171055
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer,de.comp.sys.st

Hi all !!

For all who waited for a possibility to conect their Ethernetcard from
PAM's (Germany), here is the solution:

Torsten Lang and I made some changes in the Riebel card software from the
University of Vienna. It is now possible to use it with PAM's VME and
EMega Ethernet card. Further information: See the readme file.

The software was uploaded to fortec.tuwien.ac.at in Vienna/Austria.
It should appear in Munich as well.

For further infomation email me (address below) or
torsten.lang@physik.uni-giessen.de directly.

Have fun !

Martin

2716. Re: CD-ROMS on the ST

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 16:15:00 UTC
From: christian.mittendorf@ostkupan.ct.se
Message-ID: <ftn_2.203.202.11$fidonet.org_2f4a18e1_Christian.Mittendorf@ostkupan.ct.se>
Source record: 171195

In a message of <19 Feb 95 08:57:44>, James Wood (2:200/427.1) writes:

JW> I see others posting about CD-ROMS for the ST. Does anyone know if
JW> there's actually any software out?????
Mostly PD/SW collections are available for the ST. I think that almost 13
different collections are available now. Hopefully could we see a Linux.68k
Distribution in the future. Has anybody infos about this projekt?

The following CD's with ATARI software are available now:

Dieter Lohrum: 1. Tigerstarke Software
" 2. Drachenstarke Software
" 3.
Wohlfartsst. CD 1
? Gemini CD
Maxon CD No. 1
Whiteline Alpha CD
SystemSolutions Atari Mega Archive
M. Wehner Skyline
Compo Power CD
? Crawly Crypt CD
? Bingo
? Wow

(The list was created using different ST-Computer Magazines.)

AFAIK there is also one game available - OXYD magnum. (On that CD is also the
PC and the MAC version included. It's not a special CD-game - but cheaper than
producing disks for different systems.)

JW> Is it possible to get Microsoft Bookshelf for DOS to run on the ST
JW> through a PC emulator? If I could get that to work, I'd buy a cheap
JW> CD-ROM for that reason....the online dictionary was fun.
Hmmm, I don't think so. You won't get the CD-ROM running on the emulator.

JW> What about the encylopedias and other reference works? Since most of
JW> the disc is data, is it POSSIBLE for someone to write a reader program
JW> for the Atari ST to put in Microsoft Encarta and search through it?
I think that could be possible. But it seems to be much work.

JW> Probably none available, but is it POSSIBLE? Sounds great, doesn't it?
It does, indeed. In ST-Computer 2.95 Bernd Lohrum asks if someone has started
yet or would like to start writing a server-software for different CD. He also
asks which CD the user would like to see. Here is his adress if you would like
to join this projekt or get more information:

CD-Service Bernd Lohrum
Blumenstrasse 25
D-666482 Zweibruecken

>But for american, they are wealthy to buy mac.

Oh yeh, right. All us Americans are filthy rich who can buy as many toys as we want with no worries. And by that same logic, I could say that all Europeans are sterotyping snobs, too, right? ;-)

Seriously, Macs are _much_ more affordable now than they used to be. In fact, they offer considerably more computing power for the price than our beloved Falcon, IMHO (except perhaps for MIDI-specific apps). Hard to argue with a fast 68040 box for under $1K that does NOT force you to deal with DOS or Windoze. I do understand that the import duty imposed by many European countries still keeps Mac prices out of reach, however.

Doesn't matter how cheap the 'other' boxes are, though, if what you really want is an Atari! But a faster, cheaper Atari would be very nice.

My best friend and his wife run their landscaping and construction businesses using their Atari. I sold them my ST when I bought a Mega; then the Mega when I bought a TT. They also have a nice 486 with lots of memory, disk, cdrom, etc sitting right next to it with Quicken and Word etc etc... The PC is used for games. The Atari is used for business.. They're both regular people, not computer nuts and the Atari is just plain easier to use - it does everything they need for their business. They use AtariWorks plus a post-processing program I wrote to give them all the functionality they needed from Quicken in fact!

: master disk.

: I need it at long last because my clock is now about 45 mins out!

Unfortunately ICD never released their software into the public domain, so
no one _can_ send it to you. Fortunately you can get them (and ugrade
your other utilities at the same time) by calling their BBS at
(815)968-2229 and downloading NEWHOST.LZH (or something like that).

Unfortunately it is a long, long distance call to the US
(~45 minutes at 2400 baud). What you might try is dropping a line to
their Genie account (ICDINC@genie.geis.com) stating your problem, with a
little luck and all your fingers crossed, they might send you what you
need. No guarantees though.

Good luck.

2733. ATARI ST STINKS!!!!

Newsgroup: comp.sys.atari.st
Date: 1995-02-21 21:08:14 UTC
From: ma2jswc@bath.ac.uk
Message-ID: <D4DC1t.3BF@bath.ac.uk>
Source record: 171031

Has anyone noticed that their ST stinks?
This was a while ago, but I was on typing away at my program late one night, and I had the misfortune of getting my head near the keyboard, and it stank, of a warm rubbery smell, really horrid. Anyway, I swapped my STE for an STFM (+ cash), and that smelt quite bad too. Does anyone else ST keyboard smell badly? Is it the keyboard itself, or is it years of sweat poured over the keyboard?
I room was quite well ventilated (Had loads of draft in that student room!), so it wasn't stuffiness.

btw, does anyone have ST Format's email address?

2734. Re: File at UNI-KL.DE..

Sometimes a cli is easier and more efficient than a windowed interface.
Sometimes a gui is easier. All of the Unix boxes (SGI, Sun) I use have
a graphical file hierarchy interface. I find it more cumbersome than
just typing in the path. My point is, you need both.

And Suns have the worst keyboards IMHO. I can never type a sentence
without hitting a wrong key. They used to be better, but I guess we
have had some "progress".

How much simpler to type (and faster!)
- cd /to[TAB]/su[TAB]/su[TAB]/su[TAB] <rtn>
- cp <whatever>

Get a reasonable shell with file name expansion and you are lots faster
than a mouse clicking person when you are used to type. No worries about
speling, since you have to get only the first few characters right (depends
on the number of similar filenames in a directory).

I almost get a nervous breakdown when I have to use the Mac fileselector to
save my files. (Sorry, no Ataris around here.)

> If text based operation is so good, why the hell do

Because the programs are easier to handle. However, no GUI I have
^^^^^^^^
seen so far can replace a decent shell (except if the GUI contains
a text-based shell, such as Gemini).

Uh, since it should not be too much trouble to translate the program;
maybe you should write to the original developers, CCD. AFAIK these
guys still make a living from selling Atari programs. Sorry, I don't
have the address handy, maybe one of the other Germans reading this net can
fill it in.

Of course, if you find somebody who is _really_ good in hacking, (s)he
could hack a German version :-)

: Europeans are sterotyping snobs, too, right? ;-)
[snip]
: with DOS or Windoze. I do understand that the import duty imposed by many
: European countries still keeps Mac prices out of reach, however.

Import duties are the same on Atari and Mac, presumably?! Both of US origin
although of course we can thank Taiwan & China for constructing our STs.

But seriously... in the ST's heyday British/Continental Mac and PC prices
were _so_ much more than Atari that people bought Atari or Commodore.
Average earnings when I lived in the UK were significantly less than US (yes
I worked there for 3 months too), and Universities/Colleges in the US had
all sorts of special price arrangements with IBM & Apple to encourage their
students to buy PCs or Macs. I seem to recall that on many courses my US
friends enrolled in, it was a course _requirement_ to have a PC.

Why do you think that the Sinclair Spectrum (48K of RAM (very hot in use!) in
the high-end model, infuriating cassette interface (yes, 10 mins to load a
full 48K programme, assuming it worked first time), dead-flesh rubber keyboard
wavy TV picture, etc...) was a huge commercial success????!!! It was _cheap_!
A disk drive was something that one could only dream of...$$$
Mind you, I still have a warm place in my heart for my Speccy... no game has
bettered Halls of the Things yet...

> I can't see what you are trying to do, you just place all those files
> in a folder then copy the folder contents....

Problem: TOS copies file-wise. I.e. read first file into RAM, change disk,
write first file on disk, change disk, read second file into RAM, change disk,
write second file on disk ...

A RAM disk would relieve Joshua from this problem (copy all files file-wise
onto the RAMdisk, then file-wise to the other disk. No need to change disks
inbetween).

I think some replacement desktops also read in as many files as the RAM
can hold, then copy them onto the other disk. (I could be wrong, I haven't
touched my Atari for a long time...)

As to the original problem, check out the Atari FTP list posted in this
group recently. About any ftp server has at least one Ramdisk :-)

Hi, Can anyone point me to a call cost program ?

I would like to be able to configure it for my country's charges, and have it keep a log of all modem calls made and how much they cost. I presume this would have to be some sort of accessory, as I do not wish to move from my current terminal program, TAZ.

Can anyone help please ?

Thanks in advance,
Kev.

These are modules for the exensible(sp?) control panel from Atari. You need
the XCONTROL.ACC accessory. It can be found at all the usual places.

Two solutions. I've used both. First you can link with a null modem
cable and transfer files with a comms package, although I believe most
PC's will only do 9600 as standard unless enhanced. The second option is
to use the superb program GhostLink which lets your ST access PC hard
drives, CD-Roms etc... although I do fear the PC needs to be a 386 for
this, anyone confirm?

Why not use Lynx for reading News ? Just set the Enviroment-Variable
NNTPSERVER=<your NNTP-Server> and invoke Lynx with "lynx news:<newsgroup>".
It always worked fine, when i tried it. Anyway, i compile an nntp-able Version
of TIN for MiNT. Perhaps i can send it to the Net.....

In <D4465D.AD8@news.hawaii.edu>, John Perez writes:
>Is there anyone out there developing a Web browser for Atari computers?

I'm currently laying the foundations for an HTML widget in C++ using
Warwick Allison's GEM++ class library. This could easily be extended to
work as a WWW browser (when it's done, it will accept an HTML stream
from any source) by adding a URL engine.

> I just spoke with George Geczy, the author of Hyperlink for Atari
>computers. It is a Hypertext development system which supports Dbase

>for HTML, although, it is conceivable that it could be re-written or
>patched to serve this purpose. Aside from the translation, it would also
>have to be taught to telecommunicate.

MiNT-net can easily handle all the socket stuff for you, though I
haven't tried building the socket++ class library yet.

HTML can be pretty hairy to parse (I intend to use CERN's WWW library to
handle it; I've already got that ported).

> In any case, much of the work has already been done, and the
>Author is willing to sell the code (cheap) if there is another developer
>interested in continuing his work, and/or adapting Hyperlink for HTML.
> He can be reached at
> george@jmg.on.ca

It'd probably make more sense to release the source; the market for
Atari applications is drying up pretty quickly these days AFAIK.

There's also an HTML widget being worked on (by me, of course). My
intent is to make it easy to expand into a full-fledged WWW browser if
necessary.

I'm currently fighting GDOS a little over fonts so we can have a
decent-looking display.

The're all software compatible to a large extent.

From best to worse (in terms of raw CPU power):

TT
Falcon
MegaSTE
MegaST
STE
ST(F)(M)

Though the Falcon is better than the TT for graphical/sound applications
- and the STE is better than the MegaST for the same reasons.

> Ataris use a "Gem" interface, right? I became familiar with this

Yes

> this interface quite a bit and was always disappointed that it never

The Atari versions are considerably better as well.

> delay), and the F030's modem port (once again, with and without
> delay), and you can mix them (using LAN on F030/TT/MSTe and using,
> say, MIDI with an ST) It also works with Macs, and works fast!

Have you actually managed to get Duet working via the Falcon's LAN port?? When
I Emailed the author he stated that the only machine the LAN drivers worked
correctly with was the TT??

Source record: 171097

J S W Chan (ma2jswc@bath.ac.uk) posted:
: Has anyone noticed that their ST stinks?
: This was a while ago, but I was on typing away at my program late one night,
: and I had the misfortune of getting my head near the keyboard, and it
: stank, of a warm rubbery smell, really horrid. Anyway, I swapped my STE
: for an STFM (+ cash), and that smelt quite bad too. Does anyone else ST
: keyboard smell badly? Is it the keyboard itself, or is it years of sweat
: poured over the keyboard?
: I room was quite well ventilated (Had loads of draft in that student
: room!), so it wasn't stuffiness.

Well, it did sort of pong for a bit when I dropped bits of donner kebab
and some ribena on the case, and some went between the keys, but apart
from that it smells lovely :-).

And yes, I did clean it afterwards ;-).

: btw, does anyone have ST Format's email address?

Erm, something like stf@futurenet.co.uk

Paul.

2759. Re: CD ROM

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 02:20:28 UTC
From: Graham.Irvine@mettav.exnet.com
Message-ID: <793420532.10@mettav.exnet>
Source record: 171098

It was none other than EAM. Breen who wrote on 17 Feb 95 that ...:

EB>
EB> How come quotes for prices of Atari-compatible CD-ROM drives are so
EB> high? I get quoted about 200UKP (e.g. the 'Apple 300e') for these when
EB> I have seen CD-ROM drives advertised in Computer Shopper and other PC
EB> mags for only about 100UKP. I have an Atari Falcon, so I surely should

Forget those cheap ones in the Shopper they are not even that great for the PC but use some propriety interface and Are SLOW ! And also are internal so you would need to also get a Box and a power supply to use them properly (unless you already have mounted your scsi or Computer itself in an external case). There are some cartridge port interfaces for CD ROMS available but again this is expensive for Falcon owners who have the built in SCSI port. All these 'hidden' extra costs for so called cheap CDROMS are the same whatever the computer you use.

EB> be able to connect just about any CD-ROM drive to it. I just want a
EB> drive to read samples off sample CDs and perhaps play back CDs

PC's use all number of wierd and wonderful interfaces to attach CD roms including some SCSI emulation sound card type of thing. They are all mad as hatters though and You desire and need a SCSI2 drive without any added interfangler which PC people just don't understand .Toshiba or NEC seem to be the most popular makes of SCSI CD. The later are easy to find and well built but expensive. The former (Toshiba) are slightly faster and generally much cheaper but at the moment seem to be in short supply. Try mac Warehouse but they are giving me 2 weeks to replace the broken one they supplied me with :-(

EB> random-access-intensive with it. For my purposes would I be better
EB> off getting an audio-orientated CD player instead?

All CD Drives can play audio though so for a few extra quid you are better to get a data compatible one.

EB> Any information/comments would be greatly appreciated.

Get ExtendosPRo aswell from System Solutions ,it is really easy to configure and install. And works better than Metados.

From: wells_s@ix.wcc.govt.nz
Message-ID: <3ie94m$mhh@golem.wcc.govt.nz>
Source record: 171100

This cheat file it turns out has been on atari-archive for a couple of weeks now, but after downloading it, it seems that this version is also corrupted. Pity, as going through the file I found a menu which gives these options:

INFINITE AMMO:LEFT/RIGHT MOUSE TO SELECT/CANCEL:
INFINITE MEN
INTRO SKIP
PHASE SKIP(Press escape during phase)
LEVEL CHOICE

I sure could use the Phase-skip to get past Mission #9, Phase #2!

The file is presented by someone called "T-C-D" and obviously came from somewhere, (although it's a compiled STOS program, even running the "make it compatible with everything" patch doesn't help.). If someone out there has it, could they archive it and put it somewhere! I need this! :)

I know this is more than you asked for, but it may prove useful in the future... Just a little text file that I found somewhere:

Ever wondered what those TOS error messages and 'bombs' on your monitor signified? Below is a letter, originally written by Darryl May, that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==========
OK (no error).....0
Fundamental error.....1
Drive not ready.....2
Unknown command.....3
CRC error.....4
Bad request.....5
Seek error.....6
Unknown media.....7
Sector not found.....8

: RS> The USA ST-FAX does not have these locks, so you can use any name you
: RS> like, but I don't think ST-FAX is as good as COMA...

Are you referring to STraight FAX? If so, I'll say it's as good as CoMa!

: (On the other hand: If you run Coma on two different machines - one at your
: business and one at home - you'll *need* _two_ licenses! Am I right?)

I think he's OK provided he is not using them simultaneously (even for
receiving) and particularly if 1 person is using each copy.

On the subject of CoMa, I find it interesting to note that:
1) It is the only software which has so-far operated my FAX modem, and
actually sent a FAX (US Robotics Sportster 14,400)

2) When it did so, it sent the first 500 _characters_ instead of 500
lines as I am lead to believe the demo version should.

Its not that simple, the Amiga modulator needs 12volts and a Clock, I did
managed to mod it so it does not need the clock...

This clock is use the lock the CPU clock to the Colour bust clock,
but I never saw any problems with out this locking...

The Colour clock in the Amiga Modulator is not self running, it uses the CPU
clock to keep it running, I made it self running..

Been thier done that, it does not work, you need line sync during
the Frame sync period, you have to use EOR gate...

2771. Want to emulate PC on Atari

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 07:31:26 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950221232551.26067M-100000@PEAK.ORG>
Source record: 171018

With all of this talk of emulating an ST on a PC, I hope everyone hasn't forgotten about doing the opposite. I am interested in getting one of these running. All I need to do is be able to bring up WordPerfect 5.1 for DOS....so I can share files with the PeeCee people.

1) Does anybody have experience with the AT emulator that Toad sells? Does this emulate CGA graphics with a standard ST? Can all Atari Peripherals be accessed (modem, printer?). Does this use the Atari hard disk in standard ST format, or is there a sep. partition? Will this run WindoZe in "standard" mode? Will all ST RAM be supported (i.e. 4MB ST will become a 4MB PC workalike?

2) Is there one available for the Falcon? I see that in the Toad catalog, there is an advertisement for a 486 emulator, but there is no price. Is this available? Has anybody tried it?

Thanks to all who'll reply.

James

You need to un-LZH it. LZH is a different compression system to that used by
ZIP. I think the latest version is LHARC310, and should be available on the
usual sites in the Archivers sub. Get the version with the shell, it
operates in almost the same fashion as STZIP.

Al Fasoldt (alfasoldt@aol.com) wrote:
: Rufftrade? Can you supply more information on this? A good German
: translater is badly needed in the States.
: Is this a German-to-English translator?

Yup, It is a Ger -> Eng translator. A very good one at
that. Shareware, 5UKP, or equivalent of 10USD. This program is
constantly being updated, especially in the linguistic stakes.

The program can be downloaded from:
micros.hensa.ac.uk:/micros/atari/tos/p/p118/ruftrade.zip

The author is also e-mailable at cedwardsa@cix.compulink.co.uk
(Charles Edwards)

From the program....

The extension of Ruftrade's vocabulary is a continuing process. New
german manuals and readme's are run through Ruftrade, and new words
are added to the onboard lexicon after finding a best definition in
this type of context. This updating is practically a daily routine. A
recent and very effective, addition to Ruftrade's work is word-group
switching. Recurrent sense blocking phrases output by the
word-for-word exchange process are being identified and replaced by
meaningful groups. There are about 10 of these in the latest version,
and more are to come. This routine has already improved the
comprehension value considerably.

>
>

Maybe it's me being stupid, but I cannot for the life of me see the point of
having an intuitive, logical, graphical interface, then dropping it in
favour of an awkward command line system.

I have to admit to being a little confused by terminology here, too. I
always thought that a shell was a device to make the launching of programs a
sight easier than command lines. I'd cite the shell used around LHARC as an
example, while the GEM Desktop and its improved variants are really the
logical conclusion (as far as technology will let us). What you seem to be
saying is that a shell is just another term for CLI.
As for the Mac Fileselector, I can't comment as I've never moved in such
circles ;-)

However, the original point I made still stands; why do we
insist that we are improving the interface by going backwards? I'll bring
it closer with another analogy. When was the last time you bought a car
with a starting handle, manual ignition advance, and hand pumped
lubrication? To use as Transport, not as a hobby, that is. Same with
computers. The computer is a device to make certain activities easier,
quicker and in some cases viable; why should the user be FORCED to disable
half of it's labour saving facilities because users of another make don't
have them? It's like saying you must take the central locking system and
auto transmission off of your Mercedes saloon because Ford trucks don't use
it.

If you want to use a CLI environment because you find it easier, fine; but
why should I (and everyone else) be required to follow suit? "Because it's
done that way" is not an answer either. If that were the case we'd still be
writing on stone tablets with flint.

: I have a spectrum emulator for my falcon called specfalc.zip. This works
: really well for the games that come with it.
: I also found a spectrum emulator called xzx which I use on the unix
: machines at work (after hours of course :)).

: My question is, can I use the games from xzx, which are called *.z80 or
: *.sna with this specfalc emulator or any other one on my Falcon?

: I can't wait to play Rebelstar again!!

Get "Speccy", a really brilliant Spectrum emulator for 68000/030 Atari machines. It has a Z80 to SNX converter (SNX is Speccy's compressed SNA format), an SNA to SNX converter, and an SNX to SNA converter. Give it a go; it's called SPECCY.ZIP and it's really excellent. E-Mail me if you need some Speccy snapshot FTP sites.

: Thanks very much,
: Phil

pc-ditto, the software only PC emulator from Avante Garde is long out of production, and Avante Garde is long out of business.

Occasionally you'll see someone selling a copy used... I doubt there are any new copies gathering dust on store shelves. I sold mine a number of years ago for something like $25.

Note however that while it does work, it is EXTREMELY limited.

It only emulates CGA color, which eliminates running most PC software that's appeared in the last 5 or more years, but the most limiting factor is that it is EXTREMELY SLOOOOW.

Forget games, seriously... anything that does extensive calculations will be very painful... I even had trouble with Prodigy hanging up on me while pc-ditto was drawing the screens, thinking that I'd locked up or something.

There are hardware PC emulators that are much better, although even they have serious limitations.

BobR

BON-N-N-G-G-G Wrong answer. Well, right in that it has a 720k drive. Wrong
because later ones didn't have 1k44. Only the Falcon has that

I _think_ IDE hard discs are a non starter, although there have been rumours
of a ACSI<>IDE interface. SCSI is better anyway. Several versions of the
adapters from ICD (US), Translator (System Solutions, UK) Gasteiner (UK) and
GE Soft (dunno their origin) come to mind. Fully compatible HDD ready to
plug in and go are available from most sources (at a price!)

>lost as to what to try next. any suggestions welcome.

As it is indicated by .LZH, you have to unpack it with LHarc. I progose
the latest version which includes a really nice shell.
I think it is version 3.x. The file can be found on many ftp-servers.
By the way the shell looks a bit like the STZip shell, but is much better...

Bye, MC.

PS: Maybe You have to unpack the LHarc itself...
Good luck :)

Source record: 171026

Subject: Magic? Benchmarks?

In <FBPTAHXRUP@galaxy.teuto.de>, Hendr!K wrote:

] Benchmarks usually show the speed of the particluar compiler and not the
] machine itself.

This is not completely true, Hendrik. Although benchmarks for comparing the speed of compilers are common, there are also benchmarks for comparing the integer and floating point speeds of microprocessors, or whole computers. They are called SPECint92 and SPECfp92, and take the combined result of 6 tests and 14 tests respectively.

The ratings compare the speed of the processor to a CISC based VAX 780 which is used as the unity value for the SPEC suite. That means the VAX 780 has a SPECint92 of 1.0 and a SPECfp92 of 1.0. Unfortunatley I haven't got values for the 68040 and 80486, but for comparison's sake, here are some others:

Processor: Intel PowerPC PowerPC DEC Alpha IBM
Pentium 601 603 21064 Power2
Clock frequency: 67MHz 80MHz 80MHz 275MHz 72MHz
Max Instructions per cycle: 2 3 3 2 6
SPECint92: 62 85 75 170 126
SPECfp92: 67 105 85 290 260

[Data from "The Microprocessor Report", December 1993]

The performance of a system based on a processor can depend on so many things however, like disc access speed, memory access speed, memory caching efficiency, and other concurrent processes. For example, I'm typing this on a Twin 190MHz DEC Alpha system, and it is painfully slow at times (that's because there are 47 other users running a total of 303 processes all at the same time!). When using a complicated concurrent operating system like Windows or GEM/TOS, (no comments on Windows please - I know!) there can be many invisible processes going on while your program is running. The SPECmarks are assembler routines using 100% of the machine's availability, and therefore may not reflect exactly the performance of a certain computer running a certain operating system.

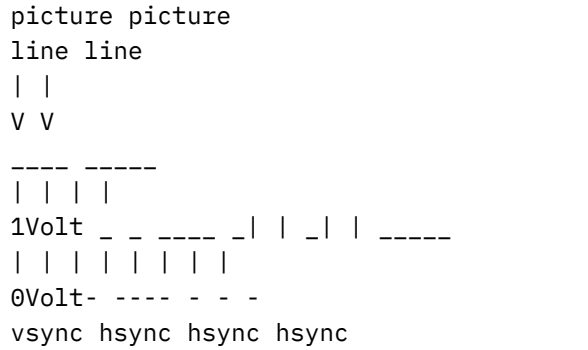
I believe that the composite signal on pin 2 is actually contains composite video i.e. it contains composite sync information as well as picture info.



You may find that the composite video signal can be connected to a monitors composite sync input (requiring the same timing but TTL levels and no picture information) and the monitor will sync up to it. Try it and see.

2799. Changes to HENSA Access...

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 13:08:43 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <3ifd0r$ju7@epsilon.qmw.ac.uk>
Source record: 171029

Hi all

There have been some changes (in the right direction for all of you),
to HENSA access.

Here is the gist of it... (all times in GMT/BST)

Gopher and WWW:
8am - 8pm NO accesses to those outside ac.uk
8pm - 8am UNRESTRICTED (yes!) access to all

ftp:
8am - 8pm 30 slots for people in ac.uk, 6 for the rest
8pm - 8am more slots for ac.uk uses....and more (10 ATM, but can rise)
for others

telnet:
No restrictions at all at any time.

I hope this makes a lot of you happier about the situation. Sure makes
me feel better. Roger? You around?

Anyway, you know where to contact me for any info...

Regards
Danny

|> looking moon landscape or something (?!?) and then it bombed. Not worth
|> the hassle i guess - phil.
|>

Well, it sort of worked on my Svga monitor. I started it in ST Low, and a title screen came up, playing a piece of tracker...

It then went to another screenmode, playing what looked like an MPEG (full screen) of clips from the film.

Unfortunately, the screenmode did not look like it was VGA, but RGB (it started in the middle, and wrapped arround - just like if you dont set the VGA bit..)

I may scan through with Knife ST to see if it is patchable.... (watch out for a VGA monitor fix..... :)

2801. Re: Magic? Benchmarks?

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 13:25:13 UTC
From: hillsp@genrad.co.uk
Message-ID: <1995Feb22.132514.84@genrad.co.uk>
Source record: 171030

Subject: Magic? Benchmarks?

As a follow up to my other post about SPECmarks, I've just read that
Motorola/IBM have released their projected new SPECint92 marks for the PowerPC:

PPC620 - 330 SPECint92
PPC604 - 225 SPECint92
PPC603 - 160 SPECint92
PPC602 - 50 SPECint92
PPC601 - 125 SPECint92

And I assume the SPECfp92 marks are fairly impressive too, although
they weren't listed.

If those rumours of a "PowerST (!)" are true, then if it used a
PowerPC620 at full whack that would silence the PC brigrade for good!

>MultiTOS supports some Ctrl-Alt-Keys I know about Ctrl-Alt-Tab for
>switching application?

>Are there other Key strokes? Especially one for switching tofrom
>APPLICATIONS to ACCESORIES???

>Ciao, Arnt

There were some for the original MiNT, but they seem to do the same on MultiTOS, exept they don't work. There is one, (I thinkl it's Ctrl-Alt-F6) which on MiNT iconises all the processes. It does this on MultiTOS, exept all that happens is it clears the windows, puts a little icon with a smiley face on it in the top left corner of the screen, and then hangs. I think there is supposed to be an unreleased version of multitos which does iconised windows and programs. Atari don't seem very willing to publish it though, but why? Are they trying to kill the ST to prevent it having an effect on the JAG?

Anyway, bye for now.

2809. Need more memory!

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 14:01:36 UTC
From: thopman@uoguelph.ca
Message-ID: <3ifg40$hqf@ccshst05.cs.uoguelph.ca>
Source record: 170991

The subject really says it all...I've got 4 megs in my Mega ST, and I find it's not enough, since TeX keeps running out of memory even when I have the largest possible mem_size setting under CS-TeX. (20 page doument with lots of large tables just won't fit.) As I see it, I have a number of options:

1) Get a "kludge" memory board which will allow me to upgrade to 8 or 12 megs. Advantages: more memory, need TOS 2.06. Disadvantage: somewhat kludgy, may not suit my needs (i.e. will TeX take advantage of the extra memory if I set the memory usages large enough), need TOS 2.06.

2) Get a TT. Advantages: Speed, 1280x960x1, more memory easily possible, as well as virtual memory. Disadvantages: Need weird monitor, expensive.

3) Get a PAK. Advantage: Speed, more memory possible, as well as VM. Disadvantages: Installation, possible compatibility problems, possibly vapourware memory board, cost.

Of course, all of these are going to cost a certain amount of money. What I'd like to know is what I can expect to pay for each of the options (in US or Canadian dollars), or if there are any other (cheaper) possibilities (Getting a PC is not one.). I don't know how serious I actually am about upgrading, but depending on whether my job works out this summer, I may do so.

> --Lunatic

I have the same problem too -
Macs have very expensive software
PC's are too complicated to program in assembly, or control properly
Arc's don't have any software
Falcons look a dead end
Amigas are boring and the software is just games

I'm going to wait to see if the Atari PowerPC rumours are true. If IBM are
developing it, it could be quite good, with proper support.

Use the gzip unarchiving program, available on UMICH and the IC mirror. There is an archived file that should be called something similar. The normal zip programs won't work, and GemZIP doesn't appear to be anything to do with it. I have unarchived the .gz files recently using the gzip prog.

Yes, I think they all do. I frequently take mine to bits, and under the power supply (parts of which heat up very considerably) there is a sheet of plastic. Under one or two of the components it is bubbled up and slightly browned. I think this is almost certainly what causes the problem. If your'e using your ST for several hours the problem is likely to be worse, but the only problem is that the chemicals given off could give you a headache, since they are organic (I think). There is also a smell of ozone (given off from high voltage surfaces, but this is only significant in a monitor where the voltages are at 10's kV. The solution is just to open a window. I don't think an ioniser would help, since the chemicals are probably too small.

I have just downloaded and installed HSMODEM6 on my TT. Problems,
problems.
I installed DRVIN.PRG, SCC.PRG, MFP.prg, and MFP_TT.prg (or similar),
as told by the instructions. On rebooting, I had a strange problem
with the Modem2 link to a Sun (which goes through STalker): the
(TTY) link only worked when I typed a command, <RET>, and then sent
a break. And even then it didn't always work. I also lost my Medium
Net (midi port) connection to a MegaST.
The programs were at the end of the AUTO folder, in the order
above.
What have I done wrong (or not done right)?

Subject says it. If you've got an old megafile with a good card and a bad drive and/or power supply, I'm interested in the card, so long as it will accomodate a 30 meg rll drive. My power supply, case, and drive are all fine; I just need the card, unless you have the works (which is to say a non-working megafile with a bad drive/bad power supply) for less than the card by itself.

I'm also possibly interested in an external double-sided drive for an ST, TOS chip set greater than 1.0, trackball, joystick extensions, other small purchases.

Thanks

John Trimble

At the end of November 1994, I sent money to Karsten Isakovic to register
sysmon. (I sent it from Germany).
When I didn't get a key from KI, I sent an e-mail to his "opal" adress.
The mail did not bounce, I but I got no reply.

Does anybody happen to know what is up with Karsten? Is he still working
for the ST? If he isn't, is there any chance that I will be able to register
the last version of sysmon? When I need it, I need it BAD, and the unregistered
version is crippled.

>is sales.'

Yeh, but the article probably failed to mention the $750 million or so in
DEBT that the company probably rang up that year. :) Seriously, wasn't
this about the time that they entered into that Federated fiasco? What a
financial nightmare THAT turned out to be.

Let's face it, managment & marketing have not been Atari's strongsuits.

>RAM Gizmo. Standard SIMMs in a Falcon, right up to 16 megs.

Are you sure that's the right telephone number, Rich? I thought 'Systems for Tomorrow' was located in Joplin, Missouri (maybe they moved). And besides, in Webb City the area code is 417 and all its phone prefixes are 673. Area code 816 is in the Kansas City area, 150 miles to the north of Webb City.

How do I know? Because I spent my childhood in that little town of 6K and my parents still live there. Amazing what you come across on the nets, eh?

It's a small world after all. Hey... that's kinda catchy. :)

>of tuning. I think the problems are the different TOS+s.

Well, you didn't mention what kind of Mac you were using but I will assume that it is equipped with a 'SuperFloppy' 1.4M drive as most of the later models were. I also assume that you are trying to read 720K DSDD floppies on the Mac, not 1.4Mb HD floppies. That being the case, you might try formatting the floppies on the _Mac_ as DOS 720K floppies using Apple's PC Exchange or Insignia Software's Access PC software. If you have System 7.5 on the Mac, this capability is built-in.

Anyway, sometimes a Mac doesn't like to read floppies that have been formatted on other machines. The Atari (at least my Falcon) doesn't seem to be quite so fussy.

>I thought I heard someone say there is an Atari ST emulator for the IBM?
>If this is true, could someone tell me what FTP site (maybe UMICH?) it is
>on, and what the filename is? Thanks

Well, the only ST emulator for the PC that I know of is the Gemulator by Branch Always Software written by Darek Michoka. This is commercial software, however, and it requires the Gemulator short-slot board which plugs into your PC (along with one or more versions of TOS ROM chips). In anticipation of the question, it works quite well, actually, given that you have a fast PC to use it with (a 486DX-33 is the minimum really usable configuration, IMHO, though it will work on slower machines).

It's available from dealers such as Toad Computers or, for more info, you can email the author directly at darekm@microsoft.com.

In a previous article, gccornelius@its.dundee.ac.uk (GRAHAM CORNELIUS) wrote:

>Macs have very expensive software

I'll take exception to this one. Commercial Mac software is no more expensive
than their counterparts for the PC although -neither- is as cheap as Atari
software. The difference is in the availability, of course. ;-)

>PC's are too complicated to program in assembly, or control properly

I dunno. I think that's more a matter of taste and what you are used to.
Programming in DOS is not so tough if you can work around the 640K limit.
Programming for Windoze is another matter! The Mac's interface requires
considerable programming effort too. Neither as easy as GEM but again,
this is just IMHO. It all depends on what you are used to & trained in.

>I'm going to wait to see if the Atari PowerPC rumours are true.

Hahahhahahaaaaaa... don't hold your breath, mate. :)

>Hi there ;
> I have come accross usefull CPXs but i don't know how to run
>them. The only thing i know is that it's in some way linked to the control
>pannel acc. Help is greatly appreciated.Thanks.
> Marcos Agra
CPX's are usually kept in a CPX folder on your root directory(ie. c:\cpx)
To load them, open the XControl(ver 1.31 is best) acc. You will probably have
an empty control panel. Between the date/time and the area used for displying
loaded cpx's, there is a button you click and hold on to select your options.
I believe you have the choice of 'loading CPX's' Regardless, your next dialog
box/window will show two main icons. The one on the left shows two floppy-type
icons, the one on the right a large and small floppy-type icon. (I'm going
from memory, not having it in front of me - so please bear with me). At the
bottom is a path, which when clicked on will bring up a file selector to
denote the path you will use to store your CPX's [in this example -
c:\CPX] You click on the left most icon, and that will open a 3rd
window/dialog box with two windows in it. The window on the left displays
CPX's already loaded, the one on the right displays CPX's that you have
available to load. scroll through the list on the right and select a CPX too
load. The box at the bottom will say 'activate CPX' and you click on it
too activate it and it moves to the left most box. Once you are finished
addingthe CPX's you wish to use, exitfrom this window. Now click the icon
onthe right(big& small) and it will ask if you wish to reload CPX's, you click
on yes at this point (you better, else I've been wasting my time :^)
Exiting that window brings you back to the main windows, where you will see
your CPX's. double clicking enters the CPX. single clicking, and movingback up
to the button allows you to set up that particular icon, or remove it from
memory. Hope this helps.
good luck/bonne chance

IT'S GOING FAST FOLKS! I have removed all sold items from this list.
Updated 2-22-95!
MOST ITEMS I WILL SHIP UPS C.O.D.

For Sale. MAKE OFFERS!!!!

HARD WARE

Atari Mega ST2 upgraded to 4 megs with Z-Ram upgrade
TOS 1.04 with PC Ditto II [PC hardware emulator] installed internally
SC1224 color monitor
SM124 mono monitor
Original boxes for computer and monitors
Monitor Master
[I will sell both monitors together for $150.00 [FIRM!] and throw in the
Monitor Master switch box. As with all other items, you pay shipping.]
PC Ditto II installed internally with above computer, or I can remove
for installation into your own computer
Spectre GCR with roms and version 3.0 software
VideoKey [Allow audio/video connections to a t.v. monitor in low and
medium rez modes]
Discovery Cartridge [From Happy Computers. Excellent software backup
device and has many other uses]
IB 5 1/4 inch drive
MFD 1080 drive [3 1/2 drive works, the 5 1/4 drive non-functional
and has been removed]

APPLICATIONS SOFTWARE

Multi-TOS [Multi-tasking on your ST compatible computer]
DC Desktop
DC Utilities
Hypercard Developers Kit [For Mac or Spectre GCR users]
WordPerfect ST [Last version developed by WordPerfect]
Wordflair II
Regent Word II
TV Title 2.0
PC-Ditto [PC software emulator, slow but very compatible. Good for
occasional or emergency uses.]

GAME SOFTWARE

Purple Saturn Day
Impossible Mission 2
Championship Wrestling
Knight Orc

World Games
The Pawn
Guild of Thieves
Sinbad and the Throne of the Falcon
Rocket Ranger
The King of Chicago
Battle Chess
Midi Maze
Shufflepuck Cafe
Xenon 2 -- Megablast
Final Assault
Mean 18
Blackjack 3
Road Blasters
Jinxter
Pac-Land
The Crimson Crown
Transylvania
Questprobe -- Spiderman
Superbike Challenge
Super Kidgrid
Thundercats

Plus the following compilation packages:

Precious Metal includes:
Arkanoid Revenge Of Doh, Captain Blood, Xenon, Super Hang-On

Triad includes:
Starglider, Defender of the Crown, Barbarian
Magnum 4 includes:
Batman, After Burner, Operation Wolf, Double Dragon

Microdeal Hot Disks Volume 1 includes:
Goldrunner, Jupiter Probe, Karate Kid II, Slaygon

The Story So Far Volume 1 includes:
Beyond The Ice Palace, Buggy Boy, Ikari Warriors, and
Battleships

Mega Pack includes:
Winter Olympiad 88, Mouse Trap, Plutos, Blood Fever, Seconds
Out, Frost Byte

5 Star includes:
Barbarian, Crazy Cars, Enduro Racer, Wizball, Rampage

Action ST includes:
Deflektor, Northstar, Trailblazer, 3D Galax, Masters of the
Universe

Giants Collection includes:
Out Run, Gauntlet II, 1943, Street Fighter

Premier Collection includes:
Exolon, Nebulus, Netherworld, Zynaps

ALL ORIGINALS!!! I am also the original owner and have taken good
care of my equipment.

REMEMBER -- I WILL SHIP UPS C.O.D. CASHIERS CHECK OR MONEY ORDER ONLY.
PURCHASER PAYS SHIPPING AND C.O.D. CHARGES.

Message-ID: <339_9502240253@ship.net>
Source record: 170902

sw> Hey, finally, a replacement for sinclair!? :)
Ya, right! Like we needed one! :-)

sw> Atari being a small company has little impact on the machine
other than their lack of support for it, we've all learned to
ignore Atari and try and support 3rd parties, who usually give
us better bits anyway.

I came across an example today of why we should support 3rd party
developers. As I was reading my NET mail today, I got a phone call
from Dan at GRIBNIF. He had taken the time, at their expense to
personally phone me to offer a solution to a problem I was having
with Geneva and Tos programs bombing. Apparently Dan had seen my
post on USENET and was concerned enough to call. Now that's
service-thanks, DAN! :-)

... A feature is a bug with seniority.

2837. Hard Disk losing files/folders

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 19:35:30 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <D4F2F6.AAK@freenet.carleton.ca>
Source record: 170972

Recently, I noticed that my Quantum ELS hard disk, partitioned C-H, 1 Spectre part., was having trouble finding files. Out came Diamond Edge version 1.10, and no errors or bad sectors, or fat errors, were found in any of the partitions. I did have PC-ditto installed on Drive C for a while, and had to run AHDIFIX to get it to work, but I never formatted the drive under DOS, and haven't done much else.

Any suggestions? Would a backup of C, then a zero, recopying of the files do it, or will I have to reformat the whole HD? (might do this anyway, as I want to change my partitions around)

Any ideas/tips/hints would be appreciated.

PC ditto was the old SW version. (which I'll let go to anyone who makes me a decent offer, in US$!)

From: talbote@wc5.wl.aecl.ca
Message-ID: <22FEB95.20002624@wc5.wl.aecl.ca>
Source record: 170973

I presume you are using Flash 1.6 as a terminal accessing a Lynx WWW browser running on some other machine such as a freenet computer?

Lynx expects VT100 terminals and generally works well with VT100's. I thought the ANSI terminal specifications were compatible with VT100's (a superset of the VT100?) but perhaps they are not or perhaps Flash 1.6 does not properly implement the standard. In any case, your "hot spots" should show up as bolded and only the currently selected one should be in reverse video.

Uniterm does VT100 emulation very well. In fact it emulates a VT240 quite well. That's what I use as a terminal emulator. Nothing else I have tried so far (i.e., public domain or shareware fitting in my 520ST) works as well as Uniterm.

Emile

Message-ID: <3igc0u$ail@golem.wcc.govt.nz>
Source record: 170830

] 1. What is the small superscript "f" that appears on the packing box?
] the model seems to be 1040ST <f>. What does it stand for.

Means that the floppy-drive is built-in to the machine rather than external
as with the ST. May or may not be single-sided.

] 2. For modest operations with a program like band in a box, will I need
] to get a second disk drive?

Trying to do MIDI work without a hard-drive can get tricky, someone I
know has well over 200 disks of MIDI tracks. However, an extra double
sided external disk drive will make life easier for you.

] 3. Can a non-Atari Hard-drive be added to the system? If so, what can or
] cannot be added.

Most people with them don't use Atari drive. (Which are hideously
expensive, and very slow). You'll need an ICD or Supra SCSI/ASCI host
adaptor, DMA cable, power-supply, case and a SCSI hard-drive. Or,
just buy one from someone complete! :)

] 4. Can additional RAM be added easily? If so, how much, and is it really
] needed given the modest midi functions I have planned for the machine

1meg of RAM will be enough for _most_ functions of Band in a box which
is a pretty compact program which doesn't chew up too much RAM. Trying
to upgrade an STF isn't a simple process though, it involves unsoldering
quite a few memory chips, and then sticking new ones in. It is VERY
unlikely the chips in an STf will be socketed. There are hacks so that
you can use SIMM boards inside, someone around here will be more use on
that than me though.

h2@bu.edu (hina hirayama) had the audacity to write:

>Hi. For a long time I've been using my SLM804 laser printer and
>ICD host adaptor (+HD) successfully, with the HA being first in the
>dma chain. But now I'd like to have the SLM804 be first in the chain.
>When I set it up like that, the ICD autobooter crashes.

As I recall, from the days when I, myself, owned an SLM-804, the
printer MUST be last in the chain, because the controller doesn't
have a DMA passthrough. If the printer is first in the chain, then
technically, it's the ONLY thing in the chain. Your autobooter is
crashing because, as far as it's concerned, there's no hard drive
in the chain.

I believe what you're thinking of is the GEMulator, from Branch
Always. It's a hardware/software package...thus, you can't get it
via FTP. It's going for about $99US (plus $60 for the necessary ST
ROMS).

2849. Falcon LAN/Serial Mouse

Newsgroup: comp.sys.atari.st
Date: 1995-02-22 23:09:39 UTC
From: renfro@bnr.ca
Message-ID: <3igg7j$apm@crchh610.bnr.ca>
Source record: 170984

Is there a communication program out there that uses the Falcon
LAN port? The Ideal would be something that redirects other
programs to use the LAN port rather than the serial port.
Or maybe there is a serial mouse driver that uses the LAN port.
I want to use my pc serial mouse with my Falcon, but of course
I still need to use the modem.

If anyone can suggest solutions to this problem (current or in
development), I would greatly appreciate it. Also can anyone
reccommend a PD serial mouse driver that I can check out.

From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <D4FDDv.7n0@watserv3.uwaterloo.ca>
Source record: 170985
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hey all,

I downloaded the source for Chimera for X11R5 but I am I nowhere near
having it compiled. I haven't yet compiled anything sucessfully bacause
every single version of gcc I've tried (with anything, not just Chimera)
gives me bus errors. Anyway, is NETPBM or PBMplus alreasdy compiled
for the atari? The source distribution includes files for coverting
Degas and Spectrum pictures so I assume some atari user has already got
those tools compiled.

As well, it seems that Chimera (BTW, for those who don't know Chimera
is a graphical WEB browser for X11 that doesn't need motif) requires
a utility called xmkmf, which I assume is a make utility of X based systems,
and all its makefiles are called Imakefile. I really don't know
what I'm doing so if anyone has any suggestions for me they would
be greatly appreciated - if anyone really knows what they're doing
compiling X/network applications maybe you could e-mail me.

Thanks,
Sam

2853. Ultimate Arena

Newsgroup: comp.sys.atari.st
Date: 1995-02-23 00:00:40 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3igj78$d08@golem.wcc.govt.nz>
Source record: 170988

During my latest FTP search, I found "Ultimate Arena" in this weeks
new-files for atari.archive.umich.edu (./atari/Games/Arcade/ultarena.lzh)
Basically it's a International-Karate type game, one-on-one fighting
thing. As near as I can tell, it's 99 French Francs (~$20US) shareware,
plus an additional 20FF (~$4US) for the Falcon-enhanced version. The
game isn't too bad, with digitised sprites, which unfortunate have
very few frames. The fighting is too quick, and the opponent near
impossible to beat with any tactics other than press the button and hope
he doesn't block. The full version apparently has (rough translation
from French)

Different scenes and difficulty levels
Choice of 7 characters
A 2-player mode
5 different "interactive" arenas
Special features ("power moves" etc.)
Lotsa configurable options

It's distributed by a (presumably French) shareware outfit called "STeam"

The sound effects are all samples (6.25Khz, but "ouch" and "thud" doesn't
need to be terrible high quality :). With a not-too-bad sampled intro
while it's loading the data files (consisting of Degas .PI1 files).

The game looks promising, and if improved, (slowed down a bit, and more
frames for the characters - which probably aren't digitised, but drawn
very well), could be quite good. And for ~$20, it's certainly a lot
cheaper than Street-Fighter II :) (Which was done surprisingly well
on the ST, although as always, they could have done it much better still!)

The file is just over 200k, and takes up roughly 500K of
disk-space when dearchived. (PI1 files compress quite small, hance
the large increase :) ^e

If anyone works out how to make the user-controlled player throw the
energy-ball, tell me! :)

The only one I have seen is Logic L53C80JC2, 44 pin plcc soldered
to motherboard.

>2. How do you really know that the problem is the SCSI-chip, and
> not the SCSI-kit tower-extension card?

Before opening the Falcon, suggest you try it with a good SCSI
drive with termination, and good cable, (ie. disconnect the SCSI
kit at the Falcon SCSI2) and connect the 'good SCSI'.

>3. If you know any Atari dealer, who sells there SCSI-chips, please
> let me know ASAP.

You could try Best Electronics in USA, fax USA 408 243 8274.

Good luck, (I would send the machine back)

From: barheath@heathen.demon.co.uk
Message-ID: <950223Z005256.279barheath@heathen.demon.co.uk>
Source record: 170996

I've come to the conclusion that although I may be right in theory, it's time to be pragmatic and admit (temporarily) defeat on the subject of UNIX access via a GUI on the ST.

I now need to learn some UNIX else I shan't get anywhere. Therefore, a couple of easy questions.
1. Is there a FAQ on UNIX, or at least enough of it to access ftp sites reasonably comfortably; if so, where do I find it?
2. Can anyone recommend suitable basic reading material on UNIX so that I might get some idea of what I'm doing?

TIA

2858. Re: Obsession Demo Probs

Newsgroup: comp.sys.atari.st
Date: 1995-02-23 00:54:00 UTC
From: sven.bornemark@p56.dada.ct.se
Message-ID: <ftn_2.200.136.56$fidonet.org_2f4bdd0d_Sven.Bornemark@p56.dada.ct.se>
Source record: 170997

To: rmccall@mcs.dundee.ac.uk

Hi Rod,

There was a time when I felt I was the *only* person on earth that could *not*
run either the demo or the full version of this game, and then I saw this:

> I cannot get this to run on my Falcon (VGA) is there any setting I
> have to change?

The game rune in lo rez, right? In fact, I'm told (by chief programmer Peter
Zetterberg) that Obsession switches resolution automatically, so
start-up rez doesn't really matter...

It took quite some time to find out, but finally I discovered this:
this (killer of a) game runs at *50Hz only*!.

Me, I'm sitting here with my shiny new NEC MultiSync 3V, and this particular
(somewhat expensive) has a vertical sync range of *55* to
90Hz!

There's *no way* I can persuade my monitor to go below 55Hz! This means that
even though I sell Obsession games by the shiploads (I'm a Swedish
Atari software distributor) to happy Swedish atarians, I'm not allowed
to run the game on my own setup!

I've carried my computer over to the living room and the domestic TV, and
everything is cool there. I truly admire all the effort and energy
that went into the work behind this *beautiful* game, and also learned (from
Peter Z) that Falcon compatibility was added at a rather late stage to this
game. (Hence the >50Hz hiccups?..).

Help is at hand though - I've been assured that the Falcon-specific version
(due some time during April-May '95) will support my monitor, so
in the meantime I'll just sit here collecting enough energy and attitude
to reach the *highscore of all highscores* once the Falcon-specific version
hits my letter-box.

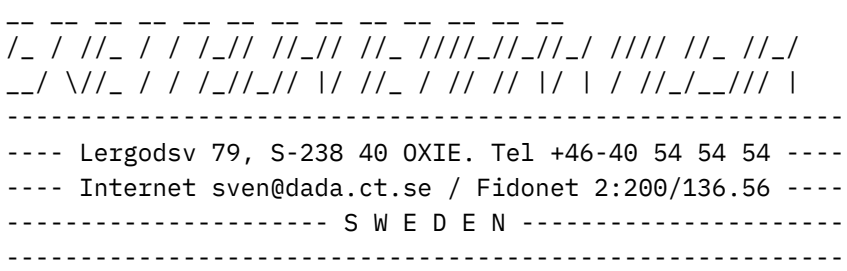
Ah yes, almost forgot - included in Obsession STE is a bonus check that allows
you to upgrade to the Falcon variety (and still keep the old version) at half
the price of a new game!

Those guys behind the game put down *megas* of hard work in this game,
and if there's someone out there who still hasn't taken a look at the demo, *do
it now!*

[End of plug section]

Yours sincerely

-Sven-



BTW, what is that *Lip Theatre* anyway. Me? I'm into Variety Shows.

(UUCP Dialup connection)

Yes that is a good way to blow up your Glue chip...

To get a real Comp Sync you need a Exor gate, as you need line sync
during the frame period....

2862. [Q] Playing Audio CDs

Newsgroup: comp.sys.atari.st
Date: 1995-02-23 04:57:22 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3ih4ji$ch7@status>
Source record: 170907

I have a Mitsumi CD ROM drive (preliminary IDE) running on my TT030 with the CD ROM interface from System Solutions. I am using ExtenDOS Pro, with the MITSUMI.BOS driver from extendos packaged w. the interface caertridge.

I can access data fine, and play Audio CDs, but only through the headphone plug on the CD ROM drive. Can I play the Audio CD using the DMAsound of the TT030? And can I get (a portion of) the sound information from the Audio CD and save it as a sample file?

I know a fair amount about programming, but not the lower level stuff.

Any help would be much appreciated!

2863. CD-ROMS on the ST

Newsgroup: comp.sys.atari.st
Date: 1995-02-23 04:58:38 UTC
From: Graham.Irvine@mettav.exnet.com
Message-ID: <793594804.0@mettav.exnet>
Source record: 170908

It was none other than All who did write on 18 Feb 95 that ....
-> I see others posting about CD-ROMS for the ST. Does anyone know if
-> there's actually any software out?????

The people to contact seem to be a company called "Its All Relative" in the US. They distribute a few interesting things. SARA which are drivers to read the various Encyclopedia type PC CDROMS ,like Groilliers <sp>. And I have just heard that they are doing a Special Atari CD rom (Not a collection of PD/shareware archives) along these lines soon, and a Demo CD is available ATM.

-> Is it possible to get Microsoft Bookshelf for DOS to run on the ST
-> through a PC emulator? If I could get that to work, I'd buy a cheap
-> CD-ROM for that reason....the online dictionary was fun.

using the above you don't need a PC emulator ,why mimic an inferior machine for sound and graphics display ??

-> What about the encylopedias and other reference works? Since most of
-> the disc is data, is it POSSIBLE for someone to write a reader program

This is SARA.

-> for the Atari ST to put in Microsoft Encarta and search through it?

To really enjoy these cd's you are going to need better than ST graphics though ,so its Falcon and TT only really although they do work I am being told with ST.

-> Probably none available, but is it POSSIBLE? Sounds great, doesn't -> it?
I wish I was a programmer.

The SARA software comes with a utility to create your own drivers for CD's that are not already directly supported so you wouldn't need to be a programmer to do it :-)

Also rumour has it that some Midi magazines are going to put Atari software on there Cover mounted CD's soon.

It`s _not_ about the money or what equipment you have, it`s how you
use your software that counts.

> but for us poor sods who could only just scrape together
> enough for a 1meg STe trying to run mint-net or whatever you guys use
> isn't much of a reality.

I can understand that, but I must point out again that downloading
files with long names has nothing to do with the hardware.

> Sure, it may be possible, but would you want
> to try doing it on a machine with a 30meg hard-drive & a max' of 4meg RAM?

As a former owner of a 520ST and a Megafile30 I think I speak
from personal experience. :-)

If you don`t have a system that can handle long filenames you`ll
just have to rename the files before downloading them.

Here`s a stupid analogy:
It`s like when christmas is over and the plastic tree goes into
storage for next christmas. If you`re short on storage-space you
disassemble the tree before storing it. OTOH, if you have plenty of
space you just store it as it is so that next christmas you won`t
need to assemble it again. The guy that is short on storage-space
is forced to assemble and disassemble the tree each year, but he`s
still able to have a plastic christmas-tree.
(see, I told you it was stupid ;-)

The point is: if you want to stay out of trouble and have a nice
system that can handle long filenames you should get a plastic
christmas-tree! Simple, isn`t it?

BTW, I do have plenty of storage-space but that doesn`t mean I put
my normal "live" christmas-tree in store. Somehow fir-trees doesn`t
look to good after a year in storage. :-)

I don't know how much of this thread I have missed, but anyway, are we talking about something to enable a reasonably fast baud rate on Atari(s)?

I found hsmoda05.lzh on micros.hensa.ac.uk under /micros/atari/tos/o/o191. Is this the same as HSMODEM but a previous version or is it something else?

Is there a more up to date version somewhere (that is accessable)?

Actually, this has recently been done. It is called Sara CD ROM software.
I have it advertised in D & P computer in OH for $47.41. It is search and
retrieval software. It contains a "five pack" and can read text and
display graphics so far for

Software Toolworks Ref Library
Wayzata World Factbook
Audobon's Multimedia Birds
" " " " Mammals
Sherlock Holmes
Shakespeare
Powerhouse Art History
Family Doctor
Time Man of the Year
CD ROM deluxe Toolworks CD

Neat, huh?

From: mbecroft@iconz.co.nz
Message-ID: <3ihhag$ldc@status>
Source record: 170920

Does anyone know of a PD or Shareware Resource Editor which will edit AES 4 colour icons (g_cicons)?

I have bought WERCS from HiSoft, and found that it didn't. I can't afford now to buy interface 2 from Compo :-(

Even just a plain colour icon editor which doesn't support any other object types would be better than nothing. However, it must allow you to edit all trees in the resource file, not just tree 1 like some icon editors.

Thank you very much for any help,
-- Mario Becroft (mbecroft@iconz.co.nz)

You are correct, it is limited and slow. However, I have had alot of use from Pc-ditto for running PC Programming langauges. I have had 3 langauges in college and of course they all run IBM's. Rather than having to spend lots of time in the college computer labs, I used (still do) PC-ditto to run the PC langauges and wrote my programs at home on my ST. I have done alot of programming with Quick Basic, Fortran, & Turbo Pascal running through Pc-Ditto. I do C programming with ST specific programs though.

That's probably true. On the Atari, Pagestream has competition (Calamus
SL) that even the Amiga PS can't touch. I can't imagine that Amiga sales are
all that hot these days either though...

]> What's a GAL ? I also want an FPU for my MegaSTE.

] It`s short for Grid Array Logic and is basically a small IC which
] can be programmed, like an EPROM I believe, to perform different
] logical operations and actions on incoming signals. Unfortunately
] I don`t know _why_ a GAL is needed in the MSTE.

Close, but not quite. GAL is the acronym for Generic Array Logic.
It is called this because a GAL can be programmed in the shape of several
of its predecessors like PALs and PLAs. It is more versatile, and has a
security bit to prevent reading of its innards. It is one-time-programmable
(although electrically erasable versions now exist) so is more like a
PROM than an EPROM. Its function is as Daniel says.
Although I am not 100% sure, it is needed in the MSTE because the
68000 cannot access the FPU directly. In the 68020 and upwards, the FPU
has its own port and connects directly to the processor. If you want to use
one with a 68000, I think it has to be mapped into memory (or intefaced
in a less direct manner anyway). It is this memory mapping, or interfacing
job which would be done by the GAL.

I think MagicMac needs an FPU to work.

Installed the demo yesterday on my Quadra 800 and my first impression is
that it works OK. In fact I get the feeling that my Mac acctually gets
MUCH faster when running MagicMac, but that may of course be due to the
greater economy in TOS/Magic as compared to MacOS.

Programs which seem to run OK:

Calamus SL
XControl
ST ZIP 2.6
LZHSHELL 3.10 (I'm not sure about the version number)
ORCS
EDITH (demo)
EDITH1 (S/W)

Programs which have problems:

PCG FontDesigner -- could not load its own native *.ECF file format, starting
and editing a new font seemed to work.

Non-working programs:

Le Redacteur -- no surprise though.

I will most definitely buy MagicMac when it becomes available for us
non-German residents.

How about:

Too large to fit on a floppy (that includes HD disks for Falcon owners)
Not the program you thought, but a patch for it.
.MSA file that's yet again corrupt on de-archiving (what's with .MSA's)
Split using a none Atari program that puts additional information into
the pieces making it almost impossible to put back together.
An update that's so full of bugs the previous version (which you've
probably just deleted) was better than.

Eh ? So how come Medusa at *64 MHz* is only 26 ??

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

In fine Atari tradition, the answer is "no". No software was ever
written to use the TT, MegaSTe, or Falcon LocalTalk port. A shame,
really.

I've also heard rumours that the TT/MSTe/Falcon LocalTalk port isn't
100% compatible with other LocalTalk ports (like on Macs, some printers,
some PC cards, etc, all of which work fine together).

dpj@delphi.com wrote:
: Regardless, Soft-Logik had already committed to the Amiga new version.
: From what I've heard in recent months, the Amiga version was selling much
: better than the Atari version could dream of - hence SL's further
: commitments to it, and lack of an Atari commitment. It all boils down
: to sales. How many new copies of Pagestream do you think Soft-Logik could
: sell today? Not upgrades, _new_ packages. Very few, I'd surmise.

Well, SL has on the Atari market tough competition with Calamus SL and
DAs Layout, that are far more felxible and professional tools than
Pagestraem. On the Amiga, Pagestream has no real competition
(BTW, why do you think don't they bother to do a PC or MAC version and
stick to a computer whose manufacturer has gone belly up?)

Advice would be greatly appreciated. I have an Atari SH204 jard drive and a Dynatek SyQuest 45 Meg removable SCSI drive. What hardware/software would be best for me in order to be running both on my STe/4 Meg? I also want to eventually run a SCSI CD-ROM drive on the Atari as well. Anyone out there have any experience/recommendations that would be helpful? (BTW, that's hard drive, not jard drive) See you at Ace '95. Thanks in advance.

2897. connect atari st to pc ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-23 14:01:11 UTC
From: erik@cp.tn.tudelft.nl
Message-ID: <erik.793548071@draconis.cp.tn.tudelft.nl>
Source record: 170942

I don't know if this is the right group for this, but I have (a) question(s).

Can you hook up an ATARI-1040STF to a PC (486DX2) so that I can use the harddisk of the PC for both machines?

Is there a program for the atari that will give me the ability to select a c:-drive (next to a an b) in the file-open selection and that the c:-drive is the harddisk of the pc?

Maybe it all sounds very stupid to ask but I was just wandering if this could be realized. It could speed up things for my atari and also a lot less trouble with all the floppydisks.

I hope someone can answer my questions or put me in the right direction to look. It would be very appreciated.

Many Thanx in Advance.

erik@sirius.co.tn.tudelft

>merely conjecturing from a position of ignorance or you were not able to use it
>properly !

Well I have seen it being run by Titan Designs/Doug Little, and I
asked them if it anti-aliased. "Yes, sure" they said, but when I asked
again more carefully, it turned out there was an anti-aliasing filter
which you could apply to a bunch of pixels, and that the basic tools
were *not* anti-aliased. The filter simply 'smudges' the image
afterwards; this is *NOT THE SAME* as having the effect built in to
the tools.

Don't get me wrong - Apex is really good, but it doesn't anti-alias.

I'm not quite sure what serial ports the TT has, but i believe there is both
an MFP and an SCC, right ? In that case you just decide what chip you want
to use, and then use that driver only. Meaning:
If you got the SCC, then use the SCC.PRG (which i think is modem2).
If you got the MFP, the use MFP_TT.PRG, (which might be modem1).

But you have to go through both drivers to tell Hsmodem you're using a TT,
(that part i can remember for sure).

Make sure your port settings have not changed. If you are networking, then make sure that your flow control is set to something compatible with the network (most likely OFF). Sometimes setup programs for nets do not even modify the flow parameter. In that case use the "Modem CPX" to set the ports, then run the net. Also, make sure that the settings on each program are set properly. Use the "SETTINGS" program to change your DRVIN, SCC, and MFP_TT programs.

Good luck, I hope that solves your problem.

I'm running the MacMagic demo on an LC630 (so no fpu) but I have to boot without any inits (hold down shift while booting). Wow, what a concept! I'm used to my trusty old STs with, at most, 1 meg of RAM, 16 colours and no hardisc. Now I can try out ST programs in 4 megs, 256 colours, running from the harddisc and ligthening fast! What an environment to develop programs in, compared to my 1040 STE.

When they make MacMagic PowerPC native it will be a perfect upgrade path. No more waiting for Atari to develop the hardware. Unfortunately almost everything I tried to run refused to work :-) but I haven't had the time to try very hard yet and it is a wonder that some do work. The demo even reads PC-discs without PC-exchange installed and doesn't choke on the Atariformatted discs like PC-exchange do.

I'm impressed.

In article <D45y95.5yp@eskimo.com>, zap@eskimo.com (Randell Spreadborogh) writes:
|> If I were to aquire a 68010 through 68040 chip could I simply pull my
|> old 68000 chip out and plug in the new chip? Is there other modifications

Assuming your ST has the 64 pin DIP version (as do all my machines),
the 68010 is pin compatible, however with exception of specific
optimization of looping instuctions (decrement and branch?), there would
be no benefit that the ST architecture could take advantage of.
I thought there was a single instruction prefetch on the 68010, but I
can't find it anywhere. Anyway, the data book does'nt state that a 16mhz version
of the 68010 is available. The only version of 68000 16mhz DIP is the 68HC000,
which is low power technology, but, other than the 6 I have in my basement,
I've never seen any. Any other versions 020,030,040 can't be done without
some kind of adapter board.

|> neccessary for this type of upgrade? Is it practicle? Other than the obvious
|> expense of the new chip is it a cheap way to go? I have both a 1040 ST and a
|> 4 meg STe with Tos 1.04 and 1.06 respectively. Any info appreciated. I do

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
How simple is this? I've though about it, but it would seem that you are
at the mercy of assuming that the processor interface is asynchronous.
Otherwise, you would might have setup/hold problems. Has anyone done this
without the benefit of an upgrade kit? If not could someone describe their
kit?

> Any pascal to C converter known ?

AFAIK, only the 'human' type. :)

And most (all?) of the language 'converters' that I've had experience
with were far from the ideal; still requiring loads of diddling to do
the conversion and _much_ more effort to optimize the code.

All in all, it's usually easier to just start from scratch.

: Marcos Agra

You answered your question yourself :) A CPX is a Control Panel Accessory, you can put as many (memory permitting) as you like into your CPX folder on your boot drive/disk and if you are running the Control Panel they will be available to you from within it. The default ones on the Falcon version include things like a Mouse Accelerator, Window Colour changer, Modem set-up, etc... but I've seen many CPX's from Biorhythm generators to a complete Basic language.

```
Excuses for bad english, correct english in full version.

Holland Game Design presents:

PING 2000, a Atari Falcon030 only game.

(Due to copyright reasons this game is called PING 2000 and not
the trade marked name)

Written by J.G. van der Leij
Music by BOB
Graphics by E. van Scheijndel and J.G. van der Leij

Technical Specifications.

PING 2000 runs on any Atari Falcon030 with at least 4MB Ram with
RGB monitors, PAL-TV, Multi Sync or VGA monitors up to 72 Hrz
Non-Interlaced. The games requires about 3MB diskspace and is
about 6MB big. PING 2000 can be played by one or two players
with joysticks or Atari joypads.

About PING 2000
```

PING was the first video game ever, when it was launched for mass market by Atari. Since then many video games have come and gone of which we have seen revivals as computer improved technically. But there has been no revival of PING until now!
As the world leaps to the next generation of gameplay Holland Game Design produced a ping clone with improved graphics and sound. PING 2000 will take you on a journey through time, and show you Ping has been a basic element of existence. We'll take you through six sectors and let you play those essential first moves in life. Through the first five sectors you have to pass twenty tests of increasingly more difficult Ping reaction moves.
The first stage will be PING 20.000.000 B.C.: the birth of the universe in which massive energy fields collide with giantic asteroids filled with rare elements. Huge gas clouds travel the vast amount of space. Here in deep space at the begining of time, you'll encouter your first Ping 20.000.000.000 B.C. action.
The second stage takes you to the time our little planet was being terra-formed. In this huge bassin of living organisms at lot of bouncing up and down was happening. Still uncertain in their ways little organismes began to spring and made their first important moves: Ping 2.000.000 B.C. moves. But watch out for those pieces of dead wood falling.

At the third stage time has progressed a little further. The
first humanoids have taken over the earth. With big bats they
start bashing every skull they meat. But hey, they are not alone
on this planet. They we're forced to play Ping 200.000 B.C. even
before your granny was born. Play it cool with the first ivory
ball, while other tribes try to distract you thier wooden balls.
The fourth stage is one of the intellectual fundamentals of
our civilisation. The basis of the original Ping was being laid,
when the first two humans started playing tennis. Ping 1500 was a
reality. Take your primitive bats and those balls to the other
side, but don't let the loosy ball boy's ball confuse you.
The fifth state is the wonderful world of Ping as we knew it
in the seventies. Finally after all these years Ping has been
computerized. Get into the computer and start playing those bits,
but don't get fooled by an occasional bug flying around.
The sixth and last stage consists of one giant stage in
which a terrible space war is being fought with great machines
dumping electerical discharges at each other. Battle is fought
throwing planets at each other. Can you stand the ultimate test?
With an ever expanding universe, each stage grows bigger and
bigger, the tests get harder and harder. Do you dare to try?

How to play PING 2000

PING 2000 is played either with the joystick or the new Atari
joypads. You can play with both at the same time, no need to
change parameters.
You start PING 2000 by clicking PING2000.PRG twice after you
have copied every file into the same directory on your harddisk.
You see a little rubble at first: this does not mean you machi-
ne has crashed; your game is loading fine. After some time the
music comes on and the title screen appears. Press fire (joypad
button A) to continue.
You now enter the selection screen. You can choose between
PING 2000, PING DUEL, PING CLASSIC and Quit to GEM.
Pressing <c> on the selection screen clears the saved games and
beasty mode setting. The porces is inreversible so be careful when
you press it.
Pressing (r) during the game returns the game to the selection
screen.
PING 2000 starts a one player game of you against the
computer. You play the right bat. You are presented with a selec-
tion screen with saved starting points and a "just start" option.
Just start will take you to the first level. Other options bring
you to the designated level. After that the information screen
comes up, you can press fire button, and wait for the main game.
As it starts the ball is hanging at the upper end of the stage.
You can move it left and right, or release it by pressing the
fire button.
If you release it the ball will fall towards a central objet,

on which it will bounce to your side! So be prepared by moving up and down to position your bat. After this your on your own.
The ball will bounce against all non-moving obstacles. It will also bounce back from the front of your and the computers bat, but it will bounce up or down if you try to get it on your top or bottom of your bat. Be quick: react!
If the ball bounces against the nasty companion or the little diamond, it will be altered in it's path in quite a random way, so watch out if the ball is heading towards one. The gas cloud in itself is neutral: it might harm you, or protect you; it might harm the computer or protect it.
The diamonds are power-ups or power-downs. You can enable most power-ups by hitting it with the ball AND being the last bat actually touching the ball. If the computer touches the ball last most of the power-ups will be cancelled. In all cases the next power-up will be released to drift into the stage.
The black diamond gives your bat greater speed. This can be positive as you can get the ball easier, or negative because the speed you are used to is altered.
The blue diamond slows your bat down. If you had taken the black diamond speeds is back to normal, otherwise you have just become a little slow.
The green diamond gives you an extra life. Extra lifes will appear in the next round.
The bright green diamond creates a very fast ball. The ball will automatically change it's direction toward the enemy, but if the enemy bounces it or the ball bounces against something different, have lighting reflexes or expect hell to pay.
The red diamond creates a slow ball. If you just had fast ball than the ball will return to normal speed, if not then the ball is just going a little bit slower, although this doesn't mean it's neccesary easier!
The bright red diamond wil make the ball fall. If the ball falls on the enemies side you're saved and are of to the next test, but if it's on your side doom is your fate.
If the ball thouches either the left or the right side it will fall. If it's the left side you win and move on to the next test. if it's the right side: pity you but you have lost a life and must try again.
Lives left are displayed at the right upper corner. For every three test made an extra life is awarded.

PING DUEL is in all respects the same as PING 2000, except for the small detail you'll need a friend to play. It's one on one in the Ping arena. All power-ups automatically fall to the one whose bat last touched the ball. Ball out is randomly distributed between the two players. It also bounces randomly from the central object. You can play it until one player lost his last life after

which victory and (almost) ever lasting glory goes to the other player.

PING CLASSIC gives you the traditional ping game and let you play against the computer. If you win the computer gets a little better, if you lose the computer gets a little slower. A life is awarded for every three wins.

Quit to GEM quits the game, as the name suggests and returns to the desktop from which you launched PING2000.PRG. Screen resolution and colours are restored.

Sound setting. Before running ping2000.prg you can set the sound level with the Sound Setup in the Control Panel. PING 2000 has been set up to not blow your boxes if you set sound level to 15.

Excuses for the bad english, correct english in full version.

I have seen previous posts from people who have put a 68010 in their ST.
I think there might be a slight increase in the multiplication speed, but
this is only about 1% better than a plain 68000. There are other problems
though, like needing TOS 2.06 or patching.

> |> 4 meg STe with Tos 1.04 and 1.06 respectively. Any info appreciated. I do

> at the mercy of assuming that the processor interface is asynchronous.

I have done this & I promised Danny (@ hensa) a long time ago that I
would post him the modification instructions.I promise to document it
properly this weekend & maybe they will be on a FTP site next week.

It's a simple modification, sometimes you don't need to change the CPU (I
didn't on my old STFM), only one logic device needed & a few wires.
It basically switches the CPU clock to 16 Mhz when the 68000 is not using
the bus. It gives only about 10-12% increase in speed though, because
there is no cache memory. But it does make an old 8 Mhz STFM a bit nicer
to use (especially it you use MiNT). Might just give you a longing for a
PAK ;)

Note: This is not my idea, I just put it together from what I picked up
here & from data books & AFAIK it was first done in Germany a long time
ago, but I never found the file.

Why don't you use PINATUBO instead? It is much better than the original
software. But still in German, though. But quite easy to use anyway.

The latest version is 1.82, only a couple of days old ;-)

From: walton@emc.com
Message-ID: <3iijnb$av@ns0.emc.com>
Source record: 170820

I have a 4 Meg upgrade board for an old 520ST. It was a 4 layer PCB
with two ribbon cables attached to it and the MMU and 'what ever the chip
in the tin can was' for address data and control, and power(!).

Well, It wouldn't work reliably until I added two large gauge wires
between to two PCBs (since ribbon cable is a poor power distribution medium),
and remove the existing 256K DRAM.

Anyway, the 520 died one day and I decided to reinstall the board in
a 1040STF. Well, needless to say, I had the same problems as before.
so I added a few more big wires, and cut the data pins from the DRAM.
Now I can't seem to add more than 24 1 Meg chips to the upgrade board,
before it BOMBs, I suspect I'm overloading the address bus.

Has anyone brought a 1040STF up to 4meg without having to remove (in it's
entirety) the existing DRAM?

From: gloganwr@is.dal.ca
Message-ID: <1995Feb23.143516.34569@ac.dal.ca>
Source record: 170823

I'll probably get flamed to the Nth degree for asking for a registered shareware game, (I've found Atari users much more defensive over that) but I'm going to ask anyway. We've had our 1040STf for a long time now, and I quite enjoy using it. Recently, I found a demo for a really cool game called Bio Hazard based on the Alien movies. Needless to say, I was impressed. Trouble is, I can't afford to register it. So, if some kind soul out there has a registered version and would care to send it to me, I'd be forever in their debt. Also, if there are similar games, I'd be interested in finding out about them...
Thanks in advance,

Source record: 170825

I finally found a working version of the cannon fodder cheat:

ftp://ftp.cnam.fr/pub/Atari/Games/cannon_fodder_cheat.gz

It un-Gnu-ZIPs to around 130K, the other was only 50K, which shows what the problem was. This version works, displays a graphical menu, plays really bad chip music. I'll send it of to hensa and a.a.u.e in a minute. Finally, I can get past that mission! :)

ftp.cnam.fr seems to have a pretty good collection of Atari STuff as well, check it out!

That's not true. I have a 14k4 modem with a CSLIP connection
attached to my 486 (Linux) and running remote X applications is
workable. For Mosaic, you would probably have to disable picture
loading, though.

Best of luck, Glenn! Your *future* depends on it, at least from where I stand.

If all else fails, try running your game on a Falcon with Backward - not
the ideal solution, but better than nothing.

I for one am keeping my fingers crossed - no Non-Falcon-games enter my Atari
software catalogue! Games *should* run off hard disks too!

Yours sincerely

>TIA for any help that you can give.

You must un-LZH it... But that is not important at this time, - do not
waste your time. Connect is NOT good and in fact is useless. Intention of
a programmer was good - to use GEM-TOS environment to it's maximum, but
then he "overkill" it so much that menus are popping out everywhere
unexpectedly and on wrong places. Very difficult for any user to even get
used to it. There is a lot of gimmicks (like spinning coursor etc). I've
looked at it, tried it, and trew it away.... It gives you 30 hours
testing time - one needs that much just to learn it. Fully operational
version sets you back 60 deutch marks - all for something what looks like
a gimmicky toy... If you looking for comm prog than you should look at
Stalker with it's 'Mac' like logic = commands lined up on top with drop
down menus.

>I have the same problem too -
>Macs have very expensive software
>PC's are too complicated to program in assembly, or control properly
>Arc's don't have any software
>Falcons look a dead end

Not necesarily. There is a lot of stuff coming out for the Falcon that
uses the DSP, which run fast enough to be competitive with other platforms.
I've recently been playing with the Vision paint programme, and it just motors
with it's DSP code. I'd say it's "about as fast" as the stuff I run on the
68040 Macs we have at our university. I haven't run benchmarks, and comparing
two entirely different software packages on two different OS's is tenuous to
say the least, but beleive me, the speed is there.
If you believe that there is a future for the TOS platform (which I
certainly do) then you can be assured that the new software developments and
future software developments will support the Falcon and TT at least. For the
price of a Falcon, you still get excellent value.

>Amigas are boring and the software is just games

Actually I think the Amigas still have a solid video creation and editing
platform, but now you're talking dead end! Commodore is gonzo, and nobody is
making Amiga clones or cloning the operating system. All hopes rest on
Commies' revival, and I wouldn't bet on a dead horse even if miracles could
happen!

>
>I'm going to wait to see if the Atari PowerPC rumours are true. If IBM are
>developing it, it could be quite good, with proper support.

Chances are good that you will be able to get a PPC running TOS soon,
IMHO, but I don't know about IBM being the ones behind it... Better chance of
Magic running on a Power Mac first. There are also at least two possible Atari
PPC clone manufacturers who may work in colaboration with the Behnes. I'm not
so sure it's a good idea to bet on Atari themselves doing it, but that is
becoming increasingly irrelevant. The TOS platform is no longer Atari's

domain. (if you'll excuse the pun)

2947. crippleware - how crippled?

Newsgroup: comp.sys.atari.st
Date: 1995-02-24 01:15:28 UTC
From: vegard@henry.interlink.no
Message-ID: <3ijbvg$qji@henry.interlink.no>
Source record: 170844

I am about to release my second shareware release. The first was a mono art program called Munch witch got 93% in ST Format and 5 out of 5 stars in ST Review. It was slightly crippled, in that no pictures larger than the ST high screen could be saved in other than my own format in the release version. It was on ST Formats subscriber disk. As registrations number a (for me) rather disappointing 20 to date, I'm beginning to wonder if I did not cripple it *enough*, or if the ST market really is *that* small...

Now, about to release another shareware program, I would like to hear some opinions regarding crippleware. How much is *too* much? Should I just release an unrestricted version and hope for the best? What do *you* think? If anybody has experience in the shareware scene, I'd especcially like to here from you, but all opinions are valid.

BTW, the program in question is called FrontEnd, and can be described as a kind of GEM based "visual GFA basic". I'll post more when I upload...

Do you have a source and a date for that statement?

Not that I expect any kind of massive release for the 060 since Atari clones are the only possible market for them that I'm aware of, but I have not heard any such official statement that resembles what you're saying.

Yes. Smiley finger was temporarily inactivated at the time.
As for Roger being a Brit in the first place, I gather he's been in the
Antipodes for long enough to be a pseudo-colonial now anyway :-)

Facts are that the Medusa060 was demonstrated at shows so we know it
exists and if you call Motorola they will tell you that they have prototypes
for it too.

I have heard of an amiga060 accelerator, but not sure about details

Cheers

From: misc223@csc.canterbury.ac.nz
Message-ID: <1995Feb24.152728@cantva>
Source record: 170851

Thanks to all the people who answered this thread and the other one which seemed to arrive at my news server a couple of hours after I posted my request, for pointing me in the direction of GhostLink.

Now that I know where to get it, I have just a couple of questions:
1) Does it work with MiNT at all?
2) Is there any possibility of it becoming available as a MiNT device driver and/or file system?
OK, maybe another:
3) Is there a newer version coming out soon?

Thanks again! I haven't seen so many replies to a question since I started the Minix vs. Linux thread.

Ah yeah, it's a real pig that one, at the bottom right of the level is
a fern-plant (looks like one anyway), blow it up, and there's 50
guided-rockets under it which make things much easier, also, up the
path above the enemy bunkers is a hidden powerup to make one soldier
an instant general which boosts his intelligence.

The only way to do it is slow & easy, blow up anything that will
blow up as soon as it's in range.

> down menus.

In fact partly you are right. Connect needs some learning time. Most users
however have no problems doing this withing 5 to 10 hours of looking
into the extensive online help and testing the full functionality within
the 30hours granted by the program. Most users - obviously not all ;-)

Connect gives you a lot of opportunities over Stalker - *fully* functional
vt100 emulation, vt220 and tek4014. Several ports can be used at the
same time - full support for HsModa. Very fast intenal Z-Modem. Very
fast output speed (taking into account, Connect is a GEM based program).
And lots of others... Some of the features *require* window menus
which are more and more common in modern GEM programs.

I really don't get your point. Perhaps the fact that *you* need 30hours to
understand at least some of the functionality is the reason for your
'remark'.

2971. Searching for ST demos

Newsgroup: comp.sys.atari.st
Date: 1995-02-24 08:39:25 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950224003728.20280G-100000@PEAK.ORG>
Source record: 170871

Can anybody recommend an ftp site for all the good old ST demos, and/or some new ones?

I remember ones like "boink" - the Amiga ball demo on the ST.
There as also "Fujiboink" - which was a spinning Atari Fuji symbol that bounced around like a ball.

Anybody know of other neat demos like that?

James

2972. [Q] Serial Mouse Driver

Yep, it's called p2c or pas2c. It works with gnucc (at least the docs say so)
I tried to compile it's output with Lattice C. It worked for short programs
like "hello world", but failed for long ones like the basic interpreter
included. Lattice just stopped working and bombed out (Some nasty code that
must have been). I think it's still at Umich/programming or /mint

I don't know about any UNIX FAQs. As for reading material, I learnt
UNIX from the book "Teach yourself UNIX - Second Edition" by Kevin Reichard
and Eric F Johnson, published by MIS Press. It's ideally written - not too
hard, not too basic - for computer literate people. I just hope you can
afford it at 20 quid!

Yes, your right, MagicMac cannot run under 68020 emulation on a PowerMac
-- doesn't emulate the FPU. I generalized this to hold for all non-FPU
Macs, which was quite obviously not a correct generalization.

Sorry!

Atari (and Amiga, and possibly Mac) computers are (or were) only a tiny portion of the sales of 680x0 CPU chips... they are used in industrial control applications, VME systems, scientific applications, even in appliance controls.

I'm sure the scientific instrumentation industy could make good use of the 68060...

Its not the duty here is the very gready Agents here and the retail mark
ups that we have, 40% is very common as a retail mark up, I don't know
the Agents mark up, but the later Macs here are 5 times the USA price, but
our $$ is only 1.5 times the USA one....

Our Tax (GST) is 12.5 %, this is a sales tax, no import duty on computers
here....

Yes some one has posted it on GEnie....

How about a list of these translators, I think this could be the forth
that I know of, also can we have a Directory on all sites for these,
I seem to be having problems in finding the last one that I had and lost,
due to a hard drive hick up...

Most sites have a TEXT directory, all we need to add to this
is the Translator directory, or place it in the Utils under Translators...

Assuming you're running Speedo 4, I'd say try Speedo 5 and/or NVDI 3.
If you're running Speedo 5 already, I don't know what to suggest!!

Certainly the printer drivers in NVDI are completely rewritten, so
they avoid this bug (or contain a work-around internally for it).

Have you ever programmed using DOS? Then you know that it is almost
impossible to use more then 64KB memory inone piece - even on a Pentium
with 32MB of RAM...

Have you ever programmed with Windows? Then you know how much there is
to do, just to see a tiny dialog window on the screen...

have you ever programmed on a Mac? Then you know that - even if the
graphical environment is rather good - many simple things like
buttons and so on must be draw by you program itself...

Just a few things that work much easier on an ATARI with GEM.

I am trying to run WAM Prolog 68 on my 520STfm. It takes up
a lot of room. The only way I can release enough memory to get it to
run is to unplug my hard disk and run it from the floppy. This is
very slow.

Does anyone know how to release more memory for non GEM based programs
to use ? If GEM isnt running does this make any more memory
available ?

Is it possible to expand the memory of a 520STfm ?

Many Thanks

Bye, TschuSS, A bientot,

Chris Young

Q&A: I have a couple programs for loading/converting Gif's on the ST,
however I have a GIF that is in the JPG format (is this a compressed format?)
and can't load it. Is there a prg on the ST that will change it back to a
normal GIF file?

```
__ _____ ___ __ __ ____ ____ ______ __ __
__ / // _ // _// // / / // __//_ __// // /
/ // // _ // / / / / / // /- / / / _ /
\___//_//_//__//_/\__\ /___//___/ /_/ /_//_/
```

Hello,

>But that is not important at this time, - do not waste your time. Connect is NOT
>good and in fact is useless. Intention of a programmer was good - to use GEM-TOS
>environment to it's maximum, but then he "overkill" it so much that menus are
>popping out everywhere unexpectedly and on wrong places.

Oh, I like this kind of sophisticated critics.

"Everywhere"? Menus show up where they are expected to show up - below menu titles which are lined up in a so-called "menu bar". Or do you have problems with window menus? Is it necessary to say that also window menus have titles which give usually a good clue regarding the place window menus will show up? "Unexpectedly"? One should wonder, which kind of mouse usage you are practising.

But I have to admit, that "useless" is quite a good joke.

>Very difficult for any user to even get used to it..

There's quite a big amount of users which seem not to have any problems to get used to it.

>(like spinning coursor etc)

What is that? I can imagine a block cursor, either blinking or not. Spinning, you say? Which axis?

>It gives you 30 hours testing time - one needs that much just to learn it..

Obviously not everybody - only some.

>If you looking for comm prog than you should look at Stalker with it's 'Mac'
>like logic = commands lined up on top with drop down menus.

If it would be Mac-like, it would have pull-down menus, not drop-down menus. Of course, in CoNnect one can choose the menu-type, one likes most. But maybe that's too much of convenience.

Get a life,
Philipp

Help...someone please....

On my Falcon, stupid me was messing around with the NVRam settings
using the NVRam CPX. I set it to 80 columns, 256 colours, VGA, and ST
modes..

Now, as soon as I switch on the computer, I get a scroling screen... :-(

Anyone able to tell me what I can do?????

Please mail, or reply here....soon....or I won't get any work done...

TIA

: > :'OK' button, I assume that this means error.

This means "The AES is not able to read the file magx.inf". This file must
reside in the root of your boot drive. Your boot drive must be a Mac folder, not
an Atari disk or floppy.
You can configure your drives during installation.

: > :
: > :I do get a green desktop & a file selector, but I get "Fehler # -66" when
: > :I try to load 'Ease'.

If Ease doesn't run make sure that magx.inf is OK (it is, of course, a Mac
file that is also used by MagiC but can be read by any Mac text editor)
and try MAGXDESK (the "native" shell for MagiC).

: > :
: > :I know that this is an Atari newsgroup, but maybe somebody has actually
: > :got this to work.

: I think MagicMac needs an FPU to work.

No, it works without FPU. Perhaps the demo version is a very old one.

: Installed the demo yesterday on my Quadra 800 and my first impression is
: that it works OK. In fact I get the feeling that my Mac acctually gets
: MUCH faster when running MagicMac, but that may of course be due to the
: greater economy in TOS/Magic as compared to MacOS.

No. MagiC uses it's own video drivers. Apple's driver is called "quick draw",
but MagiC's drivers are much quicker. They directly access the hardware. The
window library is also faster than that of MacOS. Don't forget that MagiC is
written in assembler.

I have no probs getting Obsession to run on my VGA monitor - admittedly it
is an SVGA, but it won't sync down to RGB standards....

I do remember having problems with something I had in my AUTO folder - and
it wasn't NVDI!!! Whatever it was I don't use it now so I no longer have
any probs, but I can't for the life of me remember what it was!!! I'll try
and find out tonight for everyone!!!!

But it seems to work fine with NVDI, SpeedoGDOS, Before Dawn, Maccel, Tabby,
and all the other stuff I have in my AUTO folder (Hey - I bring my machine
down from 4 meg to just under 2.5 meg on bootup!!!)...

>soul out there has a registered version and would care to send it to me,
>I'd be forever in their debt. Also, if there are similar games, I'd be
>interested in finding out about them...

What is so gosh darned imperative about a game, ANY game, that makes you want to place a public post asking for an illegal copy. Sure, some will say it's -only- a shareware product so it's no big deal. But it -is- a big deal... at least to the author of the software and those of us who are mature enough to recognize the damage that piracy can inflict.

I sympathize with you because (a) you are so flat broke that you cannot afford whatever the measly registration fee is for this game and (b) you evidently have so little self-respect since you don't care what others may think of you. Sorry, I can't think of any game worth that!

Take your request to the pirate BBS's. Anywhere but here, please. Software developers and authors visit this newsgroup too and contrary to popular opinion, we have feelings too.

Grrrrr.....

> used to it.

I don't agree, on many levels, to this critique of Connect.

Connect indeed uses GEM to the maximum and it uses it very well. Menus
are well laid out and logical and it's functionality is superb. It also
boasts VT-102 and Ansi emulation at least as good as Uniterm's.

> a gimmicky toy... If you looking for comm prog than you should look at
> Stalker with it's 'Mac' like logic = commands lined up on top with drop
> down menus.

STalker just doesn't have the functionality that I require, I'm afraid -
no auto-learning of scripts, poor VT-102 and ANSI emulation and lots of
bits and bobs missing. I also don't like it's interface, which is looking
more and more non-standard beside stuff like Papyrus and, indeed, Connect.

All of which proves (I suppose) that there are different opinions to be
expressed about Atari terminal software and as Connect's shareware at
least you can try before you buy.

Graeme

>and find out tonight for everyone!!!!

It's the Tabby prog it had problems with - when I run Obsession with the
Tabby driver installed I just get a black screen. Oddly enough, when I ran
it without the Tablet connected it seened to work fine, but perhaps thats
because the driver didn't load itself into the system as the Tablet wasn't
present.

So, I presume this is no help at all - I don't think many people have the
Tabby Graphics Tablets :) But perhaps it's something to do with stuff connected
to the serial port..... Try it and see.....

>Can you tell me of a machine and software that will (at under 30,000UKP or $ or
>even DM) do the above in a "reasonable time " what ever you define this to be.

A PC with a VISTA-gfx-board, and VISTA-TIPS as the paint-application. Don't remember the name of the animator, though. The gxf-board has up to 16 megs of RAM (TC in 768 x 576, _plus_ alpha-channel, plus UNDO-buffer). All calculations run on the board itself. The PC is only used as a storage-device.

Setups similar to this were used by our customers a couple of years ago. They did professional animation work for all major German TV-stations.

> HM> Could be. I'd still never buy a Falcon. In hi-colour modes, the speed

Yeah right.

>Hi colour is not merely slow but on a standard 8meg PC is unuseable under
>windows due either to running out of memory or the GDI resources bug.

You'd better not tell our PC's at work. They might consider doing that. If you describe such as system as slow, you obviously didn't pick the right components or the setup isnt working well, too.

Have you seen a nice PCI-board with 2 megs of RAM in a nicely choosen and configured system? Heym that's what I call fast, even in TC and high-res. The Falcon's bus-speed in its TC-mode (which actually isn't real TC), is only slightly faster than a stock 8 mhz ST.

: This may be in some FAQ somewhwre but I couldn't find it.

: What patches are recommended for the first release on TOS1.6 for the STE
: and what do they do ? Replies by E-mail if possible.

Other than the usual patch(es) to the serial port the only one that I can
think of is STEFIX.PRG. This should be on your language disk, the one
that was originally included with you computer. The STe wouldn't boot
into medium rez when connected to a colour monitor, STEFIX fixes this.
Another way to fix this is to edit your DESKTOP.INF file manually. Look
for a line '#Z 12' or _something_ like that and change the 12 to a 13,
save it and reboot with the new DESKTOP file. The Z line should be just
before the definitions for your drive icons.

Yes, it's the fastest Atari-compatible computer you can get for a
reasonable price. Medusa's much too expensive.

] >is it, and what is the procedure? I assume I can get it from one of the
] >regular sites.
]
] You get the latest gzip, then type

The missing bit is

-d [filename]

that's it, DON'T put the ".gz" or ".z" in the filename bit as G-zip
automatically looks for this, so if I had "archive.gz" I'd type

-d archive

You can get GNU-ZIP from atari.archive.umich.edu in ./atari/Archivers/
as gzip06st.zoo

>
> Greets
> Kim
>

For the record the TT has both an MFP chip (2 actually) and an SCC chip.
The ST compatible MFP chip controls MODEM 1 port.
The TTMFP chip controls SERIAL 1 (switchable to the LAN port).
The SCC chip controls both the MODEM 2 port and the SERIAL 2 port.

For HSMODEM on the TT you need MFP.PRG, MFP_TT.PRG and SCC.PRG. Each must be
set up using SETTER.

I am currently using HSMODEM 4 on my TT with a Hayes Accura 288 V.FC modem
connected to SERIAL 2, the DTE speed (machine to modem data transfer speed)
is 115200 using NOS. I achieve this by setting the Modem port to SERIAL 2
at 150 BAUD using the Modem CPX.

Hope this will be of help.

Barry Heath (barheath@heathen.demon.co.uk) wrote:

: I have to admit to being a little confused by terminology here, too. I
: always thought that a shell was a device to make the launching of programs a
: sight easier than command lines. I'd cite the shell used around LHARC as an
: example, while the GEM Desktop and its improved variants are really the
: logical conclusion (as far as technology will let us). What you seem to be
: saying is that a shell is just another term for CLI.

The original meaning of `shell' is an old Unix concept.
Unix is conceptually a nut with the Kernel in the middle and
the Shell on the outside. This is conceptually different from
OS's of the time which had commands embedded into the OS.
Whereas in Unix these commands were simply user programs that
the Kernel ran in user space.

I'm explaining this badly, I know....

What was the question?? Oh yes, the command interpreters
in Unix are referred to as shells. A shell is really just a program
for launching other programs, so apart from the graphics, there
is no conceptual difference between a CLI or Gem Shell.

I recieved a reply on the "black page syndrome" from Robert Engberson of
COMPO U.S.A. He said that the BPS occurs when printing from Atari Works in
memory-tight configurations, and only when printing to HPs for some reason. He
said that the bug was in Atari Works, not GDOS, and there was going to be an
update to GDOS which would replace the faulty code with good code available
soon. I don't know if or not NVDI 3 already does this.

: available ?

: Is it possible to expand the memory of a 520STfm ?

If the programme you are running is truly non GEM Based (ie. .TOS
extension) then just put it in your Autofolder. This will free up about
32K I think.

And you can expand the memory in your 520STfm - there are lots of boards
available. Depending on the Motherboard rev. it may or may not require
soldering. If you know about electronics and have a soldering iron it
should be no problem. Just remove th case and see if the Video Shifter
and MMU is
in a socket. If it is then it just plugs in if I remember correctly.

Contact Toad Computers in the USA on toad@charm.net, or if you live in
the UK I think either Compo or Lexicor will have one:
compo@cix.compulink.co.uk and services@lexicor.com or info@lexicor.com.

Hope that helps,

That's wierd, a friend who has registered GEM-View has had no problems loading TIF Compressed files from CD ROM. My only suggestion is that the CD ROM driver might be at fault. Does the CD ROM work OK for other things? Try mailing one of the problem images along with your GEM-View version to the Author of GEM-View, and ask him what he thinks.

That didn't come across well. I bought the Geneva/NeoDesk4 combination and am having some small problems with windows bleeding through and how to configure some programs to only use small amounts of memory without automatically running them and putting them to sleep.(A configure file would be ideal.) Is anyone beside me running this combination? I also am having trouble with Stalker bombing out while doing a file transfer in the background and accessing the hard disk in the foreground. There must be a way to time events so the two events don't run into one another. Thanks for any help.

3042. Warp 9 v3.80

Newsgroup: comp.sys.atari.st
Date: 1995-02-25 01:24:06 UTC
From: ba186@freenet.buffalo.edu
Message-ID: <D4J7w7.9sM@freenet.buffalo.edu>
Source record: 170000

Hi,

I just got a copy of Warp 9 version 3.80, mainly because it was cheap and gave me a cheap opportunity to check out a screen accelerator. Of course, the first thing I saw when I opened up the manual addendum was that this doesn't work with the current version of MultiTOS, or as it seems, with MiNT 1.12 running on my system. Therefore, I was forced to go with Geneva again, but minus a desktop since I only have Neodesk 3.0x which I don't like. I am considering NeoDesk 4.0x, but alas, I don't have it. My questions are: What is the lastest version of Warp 9, and does it work with MultiTOS? Should I just look into another screen accelerator? This brings up the NVDI 3.0/SpeedoGDOS argument (if I've read correctly), since I'll be needing a GDOS program. Which do you prefer: MultiTOS or Geneva? Or perhaps the Magic or whatever one? I've been slowly upgrading my system since December, starting by replacing my old 1040STf w/TOS 1.00 with a 1040STe w/TOS 2.06 and 4 Megs. Now I am heavily into getting the software I need to make this into updated 1040STe computer and the net has been very helpful in this task. Thanks for any help you can provide me...and since I'm in here, I could use a 16-bit sample tracker program compatible with the Replay 16 Sampler!!! Thanks,

Theron

3043. Re: crippleware - how crippled?

Newsgroup: comp.sys.atari.st

Vegard Hofsoey (vegard@henry.interlink.no) wrote:
: I am about to release my second shareware release. The first was a mono art
: program called Munch witch got 93% in ST Format and 5 out of 5 stars in
: ST Review. It was slightly crippled, in that no pictures larger than the
: ST high screen could be saved in other than my own format in the release
: version. It was on ST Formats subscriber disk. As registrations number a
: (for me) rather disappointing 20 to date, I'm beginning to wonder if I
: did not cripple it *enough*, or if the ST market really is *that* small...

I can say for a start that my ANSI art program, FANSI, has recieved to less
than 16 registrations in the almost one year since it has been released.
Not very encouraging. But I too imposed very few restrictions on it: Users
could load and save their pictures as desired, and the only crippled
features in the unregistred version were the more useful drawing functions
(boxes, connected-lines, and so on). The pitiful amount of registrations
seem to suggest that perhaps more -- or at least different crippling is in
order. In your case I think it might also be the fact that Munsch is
monochrome only. I have a monochrome monitor, but almost never use it, and
though the majority of people in Germany may be mono users, the majority of
orth American, Canadian and UK users use colour monitors. That may have
also contributed to the low registations of Munsch; from what I heard it's a
very nice program.

: Now, about to release another shareware program, I would like to hear
: some opinions regarding crippleware. How much is *too* much? Should I
: just release an unrestricted version and hope for the best? What do *you*
: think? If anybody has experience in the shareware scene, I'd especcially
: like to here from you, but all opinions are valid.

DIsable save functions. It's annoying, but it's all I can see as working as
far as crippling goes. THat lets users see what the program is like fully,
but not being able to save anything means they have to register (or go
through less legal channels ... grr...)

: BTW, the program in question is called FrontEnd, and can be described as
: a kind of GEM based "visual GFA basic". I'll post more when I upload...

Sounds nice ... is it just an editor, on the order of the mythical "GFA
Basic 4.0" editor? That would be quite nice. So long as it is interpretive
as GFA has always been, and supports all the many nice features the GFA
editor has. (Partial command recognition is at least a must) If it is a
compiler shell ... have you seen Dave Munsie's G-Shell? What would it offer
over that?

We have an Atari Portfolio, and the serial interface for it. Am unfamiliar with the unit. Would like to use it to run a DOS program in the field. How can I load this to it?
Any suggestions would be appreciated.

Cory

I'm pretty sure you need to run 'twm' or another window manager. However when I run twm from either the default shell - or the xterm I start from .xconfig - twm just compains about colours - and runs white on white. It does run though and starts up other programs. I don't know twn enough to do anything useful 'blind'!

Don't do this on a partition with data on it. AFAICR MINIT *zaps*
all data when it installs the new filesystem!

I'd experiment with a floppy disk first.

> respectively. Any info appreciated. I do plan on doubling the clock
> speed to 16MHz soon on one or the other units. --

Essentially the answer is no - and the comercial solutions which solve the problems (PAK/3 etc) are good but quite expensive.

If you could aquire a suitable 68020 or 68030 then you might want to buy a bare PAK/3 board and fit it yourself. Still several hundred $s - and not for the faint hearted.

:-|

Otherwise - do as I did and buy a 2nd hand TT (or Falcon).

:-)

As for doubling the clock speed - make sure you know what you are doing! Trying to force the whole ST motherboard from 8Mhz to 16Mhz just isn't going to work - and may damage it.

Roland.

> Wrong because later ones didn't have 1k44. Only the Falcon has that

Double bong <g> If it's an early STf it may only have a 360k drive if it
hasn't been upgraded. Second, there are other machines with a 1.44Mb
drive, if my MSTE is anything to go by (also later TTs). Third, I was told
some time back that Atari actually started putting High Density drive
mechanisms into the later STEs, although they didn't use the Ajax chip or
TOS version that could control them. I don't know that for a fact myself,
but I don't have any reason to disbelieve it. The reason was that the cost
of the drive was the same.

Band-in-a-Box doesn't use samples (not v4.x anyway - don't know about v5.x).

The *only* thing pc-dito is good for is if you are learning pascal and must use the Borland Turbo Compiler (Can't help liking the Borlands "no nonsense disclaimer"). Eventually there may other ways of using pc-dito and if so it will certainly show up on this newsgroup??

"As registrations number a (for me) rather disappointing 20
to date, I'm beginning to wonder if I did not cripple it
enough, or if the ST market really is *that* small..."

There is the other side of the coin...did you cripple it too much? While it may have been perfectly useable in crippled form, did that crippled version make it clear enough what it offered over other art programs people already have? If the crippled version did not do much more than Degas Elite (which many people would have) does, and gave them little clear insight as to what the full version offered over it, most would likely elect to stay with something they already owned. Even if it did meet those two criteria, is it possible those 20 people were representative of the size of the group that saw the need for that increased capability?

A program can be technically excellent, but still can fall flat on the market due to lack of percieved need by the user.

Gemview will do the conversion (3.10 is the latest version).

I think the Falcon has improved circuitry for the parallel cable - ie. one
that is up to spec. I think it is bi-directional - I don't think normal ST's
are. Why don't you borrow a cable from a shop and if it works keep it??

Here's some ST / TT software (business) that I want to
get rid of...

All are official releases with full docs etc.

1st Mail (mail merge utility for 1st Word and some DB's)
1st Base / DB master one (nice & easy DB for ST...)
ADIMENS ST plus and ADITALK ST plus (a _very_ pro DB for
st/tt...doc's in german though)
RETOUCHE PROFESSIONAL (by far the best grayscale fotorealistic
picture tool / program.... can edit also TC-images... +
additional filters & other modules... with german doc's also)
CALAMUS 1.09N + LOTS of FONTS (15Mb) ... english version

all goes for the best offer together/separate....COD where
possible... reply by e-mail...

Markku

Get an ICD Link 2 SCSI interface. It is a superior device that will make
your Syquest purr. As long as your SH204 is set to a different device
address as the Syquest they should work fine together.

As the dialog continues we definately seem to drift away from the
original subject. I therefore took the liberty of renaming the
thread. :-)

> In terms of ease of use the biggest leap forward in recent years came when
> Rank Xerox developed the WIMP interface.
[snip]

> upmarket, while we, the Atari users in the forefront, are going BACK to the
> keyboard/cli interface that IBM has now dropped!

You are right about WIMP being a very important development, but I
think you are giving it more credit than is due. A WIMP-system is
great for moving files around, starting applications and doing things
like CAD/CAM. However, when it comes to tasks like word processing
nothing will ever beat a good typist that knows the keyboard shortcuts.
Advanced interaction with the net will also, for the forseable future,
be easier from a keyboard than from a mouse.

In order to improve the interface between human and computer we need a
new way of entering data. As long as we stick to the keyboard-approach
we will always find ourselves in situations where we are forced to
constantly switch between mouse and keyboard. Everyone that ever have
had to use such a program can testify that it reduces productivity
when one hand repetedly has to move from the keyboard to the mouse and
back again.

One way to go is to remove the movement by reducing the typing needed
to a few simple keyclicks or shortcuts. Applications that are adapted
```

to this form of entry are already available. The trick is to use the mouse for general work where the basic functions easily can be chosen from a bar of icons. The other hand is used to access special functions via either a normal keyboard or an application-adapted keyboard. It will of course always be necessary at some point to enter a string of text, but by reducing the need to switch between keyboard and mouse to a minimum one can gain a lot of productivity with f.e. CAD-packages.

IMO, the WIMP-interfaces of today does not provide the flexibility to fully replace the CLI. Admittedly there are areas (CAD f.e.) where WIMP kicks CLI back to the stoneage when it was invented, but IMO there are a lot of areas where WIMP just isn't practical to use (word processing f.e.). Having a wordprocessor that runs in a WIMP-environment but with full access to all advanced features via keyboard shortcuts is IMO the best way to go.

As I see it we will not be able to improve the current WIMP-systems until new means of data-entry has been developed. What I'm thinking of is voice recognition. Once we have the technology of cheap and reliable voice recognition the WIMP-systems as seen today will change dramatically.

> What's the point of all this? Simply to illustrate that aping the format of

> effectively dead, but so is the command line. If you we want to progress,
> why are people with the skills not working on a graphical interface for the
> net.

Because the CLI is _not_ dead. There are still many many things that just cannot be done in an easy way from a WIMP-system. The same reason gives you the answer to your question about graphical net-interfaces. There are just too many things that cannot easily be done with a mouse. Programs like Mosaic and Netscape are easy to work with and provides comfortable access to the net. However, with todays human<>computer interfaces you can never integrate complex tasks within a true WIMP-environment. Surfing the net isn't very complex, and as proven by Mosaic it's possible to write nice graphical mouse-driven browsers without forcing the user to constantly switch between mouse and keyboard. As I wrote above I think a mix of mouse and keyboard input is the best way to go, at least as long as the goal is to reduce frequent switches between the two.

If, as in the case with Atari, the userbase is so small that developing a well-designed and userfriendly program is next to pointless due to minimal sales, then we will just have to put up with the next best thing: a CLI-based program doing exactly the same. Back when Atari was a popular computer, with a relatively large userbase and a fairly good SCD (smallest common denominator(sp?)), it was easy for developers like DMC to find reasons to fully use or even improve the GEM interface to make their programs look and work better (Calamus is IMHO an excellent example). If the Atari userbase had continued to grow we would probably

have found ourselves today with the same kind of applications as Mac and Windows runs nowadays (probably with the same problems too).

Instead, Atari failed to follow up on the success of the ST, and soon the userbase began to shrink instead of grow. This forced developers (like DMC) to try to write programs that would run on as many of the computers as possible. This meant that instead of concentrating on the user-interface they had to concentrate on how to fit the whole program in one meg of memory and how to make it run from floppy. The Atari-slogan "power without the price" was at first good news to the users. However, in the long run it proved to be exactly the opposite. The low price did of course attract buyers, but at the same time it also helped to prevent sales to persons with lots of money. The persons that could have forced a faster upgrade-rate among Atari-users instead went for the much more expensive but, at that time, not so good PC.

Left in the Atari corner was a bunch of people that didn't want to spend too much on extra hardware (and yes, I was one of them). Naive as we were we thought that we had a state of the art computer and that the "power without the price" that we had bought would last a lifetime. When the software houses saw what was happening they just _had_ to adapt to the market by making software that ran on the SCD (520ST with a 720KB drive). Now, soon ten years later, the SCD within the PC industry has shifted from a 640KB XT to a 4MB 80386 while the only difference on the Atari is that you most often need 1MB. I don't know much about PC benchmarks, but I know enough to realise that instead of being a competitor, Atari has become something others wouldn't even touch with a broom.

We have now reached a point (well, we actually reached it a couple of years ago) when the number of new machines (TTs, Falcons or even 4MB STE-systems with harddrives) are so small that no serious developer can afford to write programs that only works on the new machines. There are a few exceptions (Cubase Audio and Apex Media comes to mind), but they are too few to even be counted. Other programs that claims to take full advantage of the new systems have most of the time only undergone a slight cosmetic change to look and work better in colour.

Those who normally push development of a computer, the big multinational companies, have never shown much interest in the Atari. The apparently quite poor (or maybe just naive?) Atari-users has not helped push development, and it's the fruits of this that we are eating today. :-(

Let's go back to the original argument for a second: wheter or not we should use long and/or complicated filenames where available.

In your argument I seem to detect a belief that using a GUI automatically forces you to use 8+3 filenames, and that the only way of getting long filenames on an Atari is via a CLI that forces you to learn Unix.

That's _not_ true!!!

By using a GUI that understands long filenames (Gemini or Thing) you
can keep using your computer as you use it today with the nice addition
of long filenames and preemptive multitasking.

> I know that keyboard skills are still needed, but they will alway be
> needed while ever we have text. This is where your argument about graphical
> interfaces falls down. What we need is to avoid the housekeeping
> chores.

As I've explained above the market for Atari-programs of all sorts are
minimal. That someone would sit down and redesign the current GEM
interface is IMHO not probable. Admittedly MagiC is doing wonders with
our Ataris, but it doesn't provide developers with a big enough
userbase to write programs that makes full use of MagiC (which makes
it impossible to run under plain TOS). Even if MagiC suddenly became
the technically best OS in the world it would still not sell in big
enough quantities to give developers an argument for writing MagiC-
only programs. This is, IMHO, the sad truth. :-(

> If you like it's akin to wanting an automatic washing machine to
> replace the tub, washboard and wringer (whaddyamean wot's a washboard?) This
> is precisely what the GUI does. It removes the tedious routine chores and
> leaves you free to concentrate on the task in hand.

Yes, that's correct. However, a GUI without a CLI is IMHO not nearly
as useful as a CLI without a GUI. They complement each other and should,
if possible, always be running. Just look at Gemini if you want an
excellent example! You, along with most Mac-users, might think GUIs are
a gift from the gods that makes using a computer _soo_ much easier. The
truth is that GUIs gives you the possibility to visualize what you are
doing. In some cases (f.e. CAD) it's almost necessary with a GUI to be
able to do any work, while in other cases it just gets in your way
because what you are trying to do cannot easily be translated into 2D
images and dialog boxes. Let's try an example:

Search the entire harddisk for files that matches a regular expression,
complex or not, and put all found filenames in a file for later
examination. Try to do that with a GUI and you'll see what I mean. With
a CLI you could do:

```
# cd /
# find | grep regular_expression > filenames.txt
```

> Take a nice simple operation, selecting a file on a UNIX setup:
> -cd /(must remember SPACE then FORWARD slash)
> topdirectory/subdir1/subdir2/subdir3/file <rtn>
> - Not a valid file or Directory
> - What? oh sh*t, there's a capital in there
> - cd \(bugger)b/sp /topdirectory/subdir1/subdir2/subdir3/File <rtn>
> How much simpler to:
> click(fileselector) click(drive) click(topdir) click(subdir1) click(subdir2
> click(subdir3) click(File) click [OK]

I'm quite confident that the CLI-approach is the fastest one for a good
typist. And with a CLI with filename completion (very common these days)
there's little chance of making any mistakes.

> No worries about spelling, case or anything, because the information

> learn you don't progress by going backwards. I'm sorry if I'm repeating
> myself but it has to be said.

You've got it the wrong way around. GUIs might be the taste of the
decade, but I still insist that a GUI without a CLI isn't nearly as
useful as a CLI without a GUI.

> I'm a user, not a programmer. If I were a programmer, I wouldn't fix cars

> then went to save. Except I hit ^C (close, no save) instead of ^Z (save
> then close) cos I'm not a typist. Much more difficult to get it wrong with
> GEM.

Yes, but also much slower! I admit that learning all keyboard shortcuts
might be hard since each program has it's own standard, but trust me,
it helps a lot. I'm actually typing this letter from an excellent example
of a good GUI where I _never_ have to use the mouse. Hermes (UUCP-
package) lets me do almost everything without having to move my hands
from the keyboard. This is a big advantage and I could bet just about
anything that it is much faster than a mouse-oriented approach would be!

> Why is it that when some enterprising programmer writes some useful software
> for the Atari to use the net, it's written to suit the net, not the Atari?
> _I_ don't mind paying reasonable fees for good software; I resent paying a
> small fortune for crap.

It's simply because it's the easiest and cheapest way to go. There's
not enough money in the Atari market for developers to spend the extra
time and money needed to give their programs a top of the class
interface. Besides, with the SCD-situation you can't afford to put
much extra code into a program if you want the whole userbase to be
able to run it.

[snip]
> All I am trying to say is that we MUST get up to date. Changing from GEM to
> UNIX is not the way to go, IMHO. Hiding the UNIX may be.

And IMHO you are wrong! :-) Mixing Unix and GEM is the way to go!

> ps: you mentioned using the minix setup with MultiTOS;

No, I didn't! I mentioned using MiNT and MinixFS with TOS. The difference isn't big, but quite important. I like MTOS, but I wouldn`t recommend anyone to use it because of the way it hogs the machine. Better just use MiNT and TOS. It doesn`t give you the possibility to multitask GEM-applications, but it is fast and gives you the opportunity to use MinixFS.

> can I use it with Geneva?

To use MinixFS you need to use MiNT. I'm not sure if Geneva works with MiNT, but if it does you should be able to use it.

: synchronisation signal (I saw it on a scope [the ST is a MegaST1]).
:
Well I've had some ST's during the past, and on all of them pin 2 contains
a composite *video* signal, with picture information. I've actually used
this pin to connect some of my ST's to a videorecorder.

On old ST's without RF-modulator pin 2 is not used. This is at least correct
on a old 1040STF I'm looking at this very moment. Don't know about Mega ST1,
but since this was the lates Mega ST I guess it has a modulator and therefore
a composite video on pin 2.

However this signal can be used as composite sync with most monitors and TV's.
My old Grundig colour-TV didn't have separate sync-lines on it's SCART-port,
so I used pin 2 to feed the composite sync-line. This worked fine for several
years. I have a Falcon now, but I occasionally hook up an STE to my TV using
this old cable, and it works fine.

I switched from an STe to a Mega STe. I found that some games wouldn't
work at first. If I switched the cache of or switched it back to 8mhx in
some cases that most games would work.

The only game I regularly use(d) which I still can't get to work is
Championship Manager '93, a soccer management game published in the UK by
Domark.

Whoa, Hutch, slow down half a second.

What this twonk actually asked for is for someone to "send it to me". Not a
copy, but the game. If that's correct, it strikes me that that is no worse
than selling on a game you've finished with. If, on the other hand he
really MEANT "send me a copy" then I agree entirely with every word you say.

Can't say fairer than that, can I?

Why should we?
In my case, I know of much software (PD/free/share and commercial) but much of my knowledge was gained before I hit the net. I know that most of it will be on the various ftp sites, but not necessarily precisely where. Which would you prefer - to know the name of the program and approximate location so that you only have to do a limited search, or not to know the name of the program at all?

Don't forget, someone else has had to trudge through the archive finding the thing in the first place. If they are generous enough to share their efforts with you, the least you can be is grateful.

Sheesh!

That doesn't guarentee success. I have 4M, Speedo 4.1, and the last
AtariWorks release, and an HP Deskjet 500. 90% of the time when I
print, even with just one font, I get 2-4 bombs, and crash out.

As far as I can tell, AtariWorks isn't even usable for casual word
processing; IMHO it's totally unsuited for anything. :-(

Hi there,

There was a letter about EPSS recently in this newsgroup, here is a short explanation about it.

EPSS is a Standard MIDI File player for the STE.

Unfortunately, I lost the contact address of the developpers but I'm looking for it.

If anyone knows anything about the matter, please drop me a mail!

Thanks in advance.

When reading posts like the above , I wonder if it's worth even
supporting the ST. What are authors supposed to think when they
read crap like this? The ST shareware market is small as it is,
without people blatantly advertising for free registered copies
of programs.

If you really are that hard up, may I suggest that you order a
full copy from LAPD in the UK who have a license to sell the
registered version of Bio Hazard for 3 uk pounds.

3092. Is there a vt100 as fast as TAZ vt52?

Newsgroup: comp.sys.atari.st
Date: 1995-02-25 19:10:58 UTC
From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <D4KLAA.71n@murdoch.acc.Virginia.EDU>
Source record: 170734

I have a very basic ST system (520STfm w/ 1 meg, 8Mhz 68000, TOS 1.0). I have no screen accelerator or anything to improve my computer's speed. For communications I usually use Flash 2.2 for its 100% compatible vt100 terminal, but it is VERY slow. I have a 14.4 Hayes Accura modem and want a terminal program that can keep up. TAZ, a shareware VT52/ANSI program (available at HENSA and Merit) is the best, and fastest, program that I have ever seen. It was created with the goal of being very fast even on a basic system like mine, written entirely in assembler, and does not use GEM, so it really flies. It can keep up with the modem very well- when I connect to my school mainframe the screens are updated almost as fast as on the networked computers right in the school. However, I need a VT100 to do much of my telecommunications. Flash just wasn't designed for an 8Mhz unaccelerated Atari. Anyway, my question is: Does anyone know of a vt100 program out ther that can compete with TAZ's speed on a basic system? Also, when I downloaded TAZ, the docs said that eventually there would be true VT100 compatibility (not just ANSI). This was one year ago. Has anyone heard of a new version since then, or progress towards one? I can't really use TAZ now but if it had a VT100 I would definitely register and pay a million zillion dollars. Hmm...

Has anyone seen the documentation for Duet 1.00 in English?
I have the German version, but my Deutsch is not very good.

If someone out there has installed DUET successfully, could
they post a brief English summary of the installation procedure
and operating instructions?

Thanks.
Mike

: I have a very basic ST system (520STfm w/ 1 meg, 8Mhz 68000, TOS 1.0). I
: have no screen accelerator or anything to improve my computer's speed.
: For communications I usually use Flash 2.2 for its 100% compatible vt100
: terminal, but it is VERY slow. I have a 14.4 Hayes Accura modem and want
: a terminal program that can keep up. TAZ, a shareware VT52/ANSI program
: (available at HENSA and Merit) is the best, and fastest, program that I
: have ever seen. It was created with the goal of being very fast even on a
: basic system like mine, written entirely in assembler, and does not use
: GEM, so it really flies. It can keep up with the modem very well- when I
: connect to my school mainframe the screens are updated almost as fast as
: on the networked computers right in the school. However, I need a VT100
: to do much of my telecommunications. Flash just wasn't designed for an
: 8Mhz unaccelerated Atari. Anyway, my question is: Does anyone know of a
: vt100 program out ther that can compete with TAZ's speed on a basic
: system? Also, when I downloaded TAZ, the docs said that eventually there
: would be true VT100 compatibility (not just ANSI). This was one year
: ago. Has anyone heard of a new version since then, or progress towards
: one? I can't really use TAZ now but if it had a VT100 I would definitely
: register and pay a million zillion dollars. Hmm...

ANSITerm 1.90 can easily compete with TAZ in terms of speed ... and
additionally, you don't get that irritating flicker that you get in full
ANSI mode in TAZ. (ANSITerm works in low resolution using a compressed 4x8
font... hard to read if you're on a television set, but I have no problems
reading it on my colour monitor) ANSITerm doesn't suport VT100 -- not
fully, anyway; Lynx is still a bit screwy, but I can use IRC, NCFTP, Telnet
and a host of others just fine with it.

My 1040STf (bought mid-Feb.86... 9 years old!) doesn't smell, and it's
had LOTS of nasty stuff done to it, including pouring a full mug of hot
chocolate onto the keyboard (good thing the design makes everything pour
out the front instead of onto the chips), and dumping a bowl of oatmeal
onto the keyboard. I've also got three cats, and lots of cat-hair.

About half of my keys are a different colour now, either from use
(acids and sweat from my fingers?) or just from the plastic aging.

These numbers are totally meaningless without a Mhz rating for the chip.
A 60Mhz PPC601 gets about 60-61 SPECint92 (60Mhz Pentium gets about
58-60). These are also "best-case" numbers; Pentium systems get
anywhere from ~70-95% of the "best-case" SPECint numbers, depending on
the system and how it's built.

> If those rumours of a "PowerST (!)" are true, then if it used a
>PowerPC620 at full whack that would silence the PC brigrade for good!

A PowerPC-based Atari system running TOS would be about as fast as a TT,
which would be totally pointless, unless the system could run AIX, or
Windows NT, or MacOS. Given Atari's previous adherence to industry
standards, you can bet it'd be TOS-only. Using such a system would be a
massive waste of computing power; the operating system and 100% of
applications (with the possible exception of Papyrus, Connect, GEM-View
and the dozen other apps that are still getting work done on them) would
be run in emulation like a snappy 25Mhz 68LC040 instead of a screaming
PowerPC-whatever.

Another option would be to buy a 68040-based Macintosh, and run MagicMac
or Mac-MiNT (depending on how GEM-ized your favourite TeX is). I have a
strange feeling that this would be *much* cheaper for a Canadian than
finding/buying a TT or PAK or ST RAM expansion. Then again, Macs are
still overpriced up here (though not nearly as bad as UNIX
workstations).

I like it. I agree that some parts of the user interface are not as simple as they could be but it doesn't take long to learn and it's got some nice features. I wouldn't recommend it for the ST though, it's a bit expensive on screen area.

> testing time - one needs that much just to learn it. Fully operational
> version sets you back 60 deutch marks - all for something what looks like
> a gimmicky toy...

I agree the registration is a bit steep, but I can't agree with your other comments. The user interface may look 'gimmicky' but it doesn't get in the way.

> If you looking for comm prog than you should look at Stalker with it's 'Mac'

You want the released version to work and do everything necessary, but
lack some interesting, useful, and/or fun features. What you hope is that
people will start to use it all the time until they feel guilty enough to
register.

> BTW, the program in question is called FrontEnd, and can be described as

> in any resolution. This function converts those character coordinates to pixel
> coordinates based on the current screen resolution."
>
> But using this command doesn't seem to be enough. Any better ideas or tips?

What it should have said was that all objects use character positions
where possible. If you make sure everything is character snapped you will
get a resource file that works in all resolutions but this limits you a
lot and tends to result in ugly dialogues.

If you stick to entirely pixel coordinates then everything would be in the
right place relative to each other but the text would be too big or too
small if you viewed it in the wrong mode. If, as normal, you use a mixture
of character and pixel snaps, you tend to get a horrendous mess if you use
the wrong resolution.

The only solution I know of is to use your own resource fixer that takes
into account the resolution it was created in - ie if you create one in
high res and display it in medium, anything 8 pixels tall will be counted
as half a character and hence made 4 pixels tall. The resource file code
in GEM++ does this, or you could do it yourself.

From: ba186@freenet.buffalo.edu
Message-ID: <D4KwLx.J7s@freenet.buffalo.edu>
Source record: 169902

I find this conversation very interesting concerning comm programs. I am currently playing with a unregistored version of ConNect 2.46. It works ok on my 1040STe, but my biggest problem is the terminal window, where I have to scroll back to get lines which went off screen. I suppose I could fix that with come config changes at my site of connection, but would rather not. Plus, the Script files I find confusing. I did like Storm 1.02 because it reminded me alot of Flash v1.60 (which I am trying to replace), but it had too many problems. And, with ConNect, I agree, the price is high. How good is STalker? What is the latest version and going price? And is there a demo somewhere? Thanks,

Theron

>massive 640K area.

Only if you're a complete moron, or a totally inept computer illiterate who
wouldn't be able to figure out UNIX anyway.

You think all the millions of people in the world who use PCs spend all their
time messing with configuration files..? Yeah, right...

>Add in a new card.. (blah, blah, blah)

You put in a new card, adjust everything to match the new card, and you get
on with doing what you do with your computer, but with increased capability.

You make it sound as if PC owners are slobbering idiots who spend all their
time plugging and unplugging expansion cards just so they have to change
IRQs and tinker with configuration files.

It makes for cute 'net converstation, but has nothing to do with the way the
real world works...

**** SPECIAL FEATURE ****

******************************************************
NEWS RELEASE 14: THE TORONTO ATARI FEDERATION PRESENTS - ACE '95!!
******************************************************

_/_/_/
```

accelerator for the TT, the spectacular
Cyrel Sunrise video card, and a host of
other amazing Atari products designed to
bring the most incredible creative results
out of your Atari computer. Cybercube will
demonstrating & selling their entire line of
Atari hardware and software at ACE'95, along
with a couple of exciting new products! Do
yourself a favor, check out the Cybercube booth!

The *GREATEST* ATARI EXHIBITION in *YEARS* is happening on April
1st & 2nd, 1995, in TORONTO!! We've EXPANDED our ACE '95
Exhibitors List again!!

LLLL Gribnif Software!
LLLLL TOAD Computers!
LLLLLL Branch Always Software!
LLLLLLL Cybercube Research (Cyrel)!
LLLLLLLL DMC Publishing!
LLLLLLLLL Scarborough Computers!
LLLLLLLLLL Missionware Software!
LLLLLLLLLLL ICD INC/4Play/Black Cat Designs!
LLLLLLLLLLLL It's All Relative!
LLLLLLLLLLLLL ABC Solutions!
LLLLLLLLLLLLLL Esquimalt Digital Logic (OMEN)!
LLLLLLLLLLLLLLL GEnie Information Services!
LLLLLLLLLLLLLLLL Suzy B's Software (& CDs)!
LLLLLLLLLLLLLLLLL chro_Magic!
LLLLLLLLLLLLLLLLLL Clear Thinking!
LLLLLLLLLLLLLLLLLLL Schauzmoll Software (The first GUI BBS)!
LLLLLLLLLLLLLLLLLLLL Anodyne Software (ExtenDOS)!
LLLLLLLLLLLLLLLLLLLLL Oregon Research Associates!
LLLLLLLLLLLLLLLLLLLLLL Computer Direct! (DirecTT030 & an
LLLLLLLLLLLLLLLLLLLLLLL enormous lineup of Atari products!)
LLLLLLLLLLLLLLLLLLLLLL Binary Sounds!
LLLLLLLLLLLLLLLLLLLLL Fine Tooned Engineering (MIO2, Sweet 16)
LLLLLLLLLLLLLLLLLLL Compuworld (Service, Parts, Upgrades!)
LLLLLLLLLLLLLLLLLL Encore Music (Falcon MIDI systems!)
LLLLLLLLLLLLLLLLL Wizztronics (The Falcon Rack, Barracuda!)
LLLLLLLLLLLLLLLL Steinberg/Cubase (everybody knows what they do!)

... shhh! don't tell anybody, but the c-lab falcon mkII
is going to be at ace'95, too ...

We're looking forward to CGS Computerbild's presence too, as well
as COMPO, Migraph, Best Electronics and a few more!!

****
FEATURE EXHIBITOR > DMC Publishing of Markham, Canada
****
Nathan Potechin and his brilliant
accomplices Mario and Shawn, will be

occupying 2 booths in order to show off the
spectacular POWER of Calamus SL, Outline
Art, Invision Elite and all of the other
incredible products distributed and sold by
DMC. Nathan will be featuring some stunning
Calamus demos, unbelievable sale prices and
DMC's usual (and legendary) level of
CUSTOMER SUPPORT. Do NOT miss the DMC booths!

The next ACE'95 News Release will feature still more debuts and
exciting product announcements: how'd you like to use the
GROLIER'S ENCYCLOPEDIA on your Atari .... hmmm? Stay tuned,
because SARA-CD for Grolier's will be debuting at ACE'95! It's
Great!!

=-=-=-=-=-=-
ACE'95 will feature continuous, hour-on-the-hour SEMINARS and
LECTURES. We'll be posting a Seminar schedule on March 15th!!

=-=-=-=-=-=-
A fabulous lineup of Door Prizes, Creativity Contest Prizes
.... and the ACE'95 Grand Prize!

=-=-=-=-=-=-
MIDI, DTP, Wordprocessing, Graphics, Power Computing, Software
Libraries, Utilities, Accessories, Databases, Spreadsheets,
Custom Solutions, Games, Educational, Internet, BBS, Networks,
Accelerators, Emulators, JAGUAR Stations, User Group Center,
INCREDIBLE SALE PRICES, Software, Hardware, and EVERYTHING you
need to get the VERY BEST out of your Atari!

=-=-=-=-=-=-
More ATARI USERS in one place than is particularly sensible - or
safe. Windows users .... beware ....

==========
Getting to ACE'95 is *easy*. Toronto is directly
accessed by Highway 401 or the Queen Elizabeth Way,
or Highway 400/69. Crossing the US/Canada border
at Detroit, Buffalo, Niagara Falls, Ft. Erie,
Ogdensburg, Kingston, etc., will lead you directly
to Highway 401 or the Queen Elizabeth Way. Take the
Yonge St. Ramp north off the 401 and drive to 5110
Yonge St. (5 lights) If you take the Queen Elizabeth
Way, follow the signs to get to highway 401. *ANY*
AAA or CAA or other Motor League can provide you with
a map of Toronto, Ontario & Canada. Please call us
if you have any trouble! Pearson International

Some years ago Motorola announced that the 68050 was cancelled because the 68060 was nearly completed (They work on the next and next_next generations in paralel). Something similar happened long time ago to Intel's 80186

>Pagestraem. On the Amiga, Pagestream has no real competition
>(BTW, why do you think don't they bother to do a PC or MAC version and
>stick to a computer whose manufacturer has gone belly up?)

The reason that Soft-Logik is doing an Amiga version is because it had already been started when the decision to _not_ do an Atari version was made. They had already invested time and money into the Amiga version.

As to a PC and Mac version, S-L has already announced that both are being done. They feel these markets will make them some money, to put it simply (and realistically).

3124. Atari 1040 ST System For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 03:45:21 UTC
From: ATAY10A@prodigy.com
Message-ID: <3iotgh$leg@usenetp1.news.prodigy.com>
Source record: 170670

The following Atari 1040 ST system is for sale:

1. 1040 ST internal Drive
2. Atari Monitor
3. Epson LX-90 Printer
4. External 3.5 drive
5. 150+ disks (Software on most)
6. Other purchased software with documentation
7. Trackball, Joystick, Mouse
8. Hardware device used to copy protected software for your personal backups.
9. 2400 baud modem
10. All Cables

I am looking for best offer plus shipping. I am located in NJ so the shipping
will vary. If you have any questions, just send me E-mail.

Thanks,
Jim

3125. Atari Hardware Software For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 04:16:00 UTC
From: mike.hill@cccbbs.cincinnati.oh.us
Message-ID: <8A43574.0833001BEC.uuout@cccbbs.cincinnati.oh.us>
Source record: 170688

Software and Hardware for Sale.

Hardware:
GCR: Complete, latest software and roms $100
Replay 4 Cartridge with Replay Software and Drum Beat Software $ 20

Software (Applications):
Minix for Atari ST. Comes with 480 page reference manual, disks $ 5
MVG $ 5
Abacus Forth $ 10
Holmes and Duckworth H&D Base (Database) $ 10
Beckmeyer Development Tool. Tools, C-Shell, and Make $ 5
Image Cat $ 10
Warp 9 3.70 $ 10
Pro Sprite Designer $ 5
Hippo Computer Almanac $ 5
Super Directory $ 5
Take all these Applications (shipping paid for by me) $ 50

Software (Games):
Orge (Also includes Box) $ 2
Borrowed Times $ 2
Renegade $ 2
Transylvania (Disk Only no docs) $ 2
Gato $ 2
ST Wars $ 2
Karate Kid Part II $ 2
Balance Of Power (Also includes Box) $ 2
Amazon $ 2
Perry Mason: The case of the Mandarin Murder $ 2
Farenheight 451 $ 2
Nine Princes In Amber $ 2
Time Bandits $ 2
Mean 18 $ 2
ST Karate $ 2
Hacker $ 2
Arena $ 2
ST Protector $ 2
Space Station $ 2
Hex $ 2
Match Point $ 2
Take all these games (shipping paid for by me) $ 30

Take all the games and applications (shipping paid for by me) $ 80

Books
Modern Atari System Software. Hisoft programming book. Lots of
Good info on Falcon 030 and AES4 $ 10

Take everything here (GCR, Replay, Book, Games, and Apps)
shipping paid for by me. $180

Besides the packaged options, you pay shipping. Everything will be shipped
COD or you can prepay.

Make me an offer if you don't like the prices. I want to sell it as as
complete package and will entertain those offers before piecing it out.

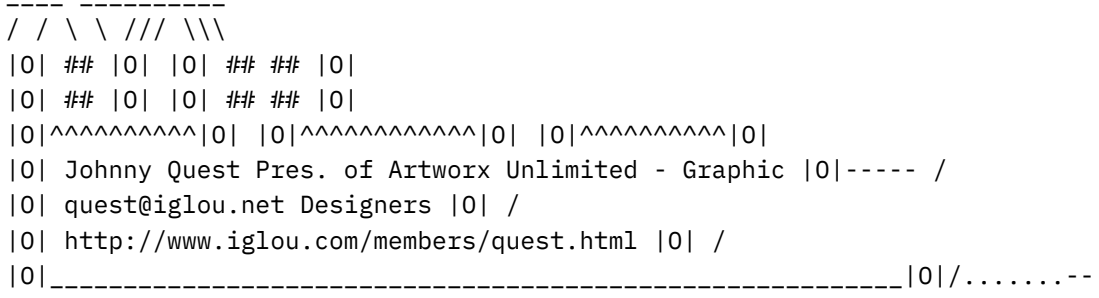
3126. Some help with MiNT

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 05:41:03 UTC
From: quest@iglou.iglou.com
Message-ID: <D4LEGF.AGA@iglou.com>
Source record: 170673

I had a few questions about running MiNT. I tried setting it up a
while back and just caused myself major hastle of blowing away my hard
drive and ending up with problems and never finished getting installed.
Here is what I am wanting to do:
Run a Slip/PPP system with a Un*x system on my Atari.
Also use a portion of the hard drive for GEM software.
Here is what I have system wise:
1040STe w/ 4 Megs
120 Meg HD. w/ ICD Link - ICD software

Can anyone give me some help deciding if I have enough system to do
this and if it is worth the trouble to set up? I could use a lot of
guidance getting started and I would really appriciate it.

Thanx,
.\\ike



3127. Re: Atari Portfolio

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 07:32:28 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3ipaqc$ruf@status.gen.nz>
Source record: 170682

Cory Downey (JBPT63A@prodigy.com) wrote:
: We have an Atari Portfolio, and the serial interface for it. Am
: unfamiliar with the unit. Would like to use it to run a DOS program in
: the field. How can I load this to it?
: Any suggestions would be appreciated.

The Portfolio is perfect for this, though depending on the application,
it may not fit into the portfolio's memory. Most Portfolio's have 128K of
RAM, but this can be expanded to 640K, and you can get 512K memory cards.
You can plug in a HDD or FDD too with the right card.

Anyhow, to the point.

If your portfolio does have enough RAM, the next thing you will need is
some kind of file transfer software. My Serial interface from Compax had
Slave plus transfer software with it. If you have Slave +, just set a
terminal on your ST up to the same configuration as Slave + displays on
loading. Then just follow the prompts on your ST Screen.

Of course you will need a null-modem cable, my Interface came with one.
If your's didn't then the Serial Interface manual tells you how to make one.

I cannot help much more than that, so good luck!

3128. Re: gemulator

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 08:33:20 UTC
From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <D4LMFK.MGF@murdoch.acc.Virginia.EDU>
Source record: 170684

You will not be able to find the GEMulator on any FTP sites for 2 reasons:

1) It is not PD or shareware- it is still sold for profit. You can get
it from Toad computers and other atari retailers if you're interested.

2) It is not exclusively software- It includes also a card that includes
a Motorola 680X0, TOS roms, etc., that slides into an expansion slot on
your ibm or clone.

Sorry to disappoint you,
John Stanmeyer

>least you can try before you buy.

>Graeme

....and Josef Palecek replies (to all inclusive original post):

I agree that my comment was too harsh... Greame is right: yes, go ahead
get unLZH prog, look at Connect how it works, see for yourselves if it is
something one would need. After all, thanks to programmers like Wolfgang
who make programs available to TRY before we buy. We also must mention
what are we using comm progs for? Do we really want to do all those
elaborate automatic connections? Running around usenet groups, Internet,
BBS's, FTPs, is really no trouble and that is what I meant in my original
comments. No intention to compare two progs - even the Stalker is with
lots of bugs in it and I will NOT upgrade it for any price they might ask,
what I've got is enough and it does it's job well. There simply isn't
perfect prog.. on market. But I must stand behind my comment about 'pop
out' windows. I could not get used to it even in those 30 hours.

Message-ID: <D4LpzF.9CG@cix.compulink.co.uk>
Source record: 170686

Well, it's finally happened. After owning nothing but Ataris since 1981, I have just sold off my Falcon with the PC now taking the role of main machine. <Sigh> I feel depressed.

What's worse is finding out how so much of my treasured kit and software is worth bugger all. I've spent 6 months slowly selling bits off and most of it went for 10-30% what I paid for it :-(

Most stuff isn't even worth the postage on sending it to people so it ended up in the bin. :-(:-(

I want my Atari back, even though it just sat there gathering dust.

Iain

3131. Re: New Atari Computer Rumour!

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 10:41:25 UTC
From: richcsst@crash.cts.com
Message-ID: <D4LsD2.8z4@crash.cts.com>
Source record: 170674

: Again, I have to wonder out loud, _why_ would anyone bother running TOS
: on a PowerPC chip? 100% of software (including system software, unless
: somebody wants to port the large sections of TOS that are still 680x0
: assembly to PowerPC assembly or C) would have to run in emulation, which
: means your snappy new PowerPC system would run about as fast as a 25Mhz
: 68040 system... and if you're going to do that, it'd make more sense to
: run a 68040 system.

Well, you see, if TOS were "improved" to be multicompliant like Apple's PowerMAC System 7.5, then you could run multimode software on that there PowerPC. Software that says "Accelerated for Power Macintosh" doesn't necessarily has 100% native PPC code. It does, however, have mixed code. The routines can be multilingual. So, if a PowerPC TOS were to be created, then both 680x0 TOS programs could be run as well as "Accelerated" PPC TOS programs. This means cross platform compatible software.

Picture this, a program that runs on both machines (680x0 & PPC), but when it is executed on a PPC it loads a special "plugin" that recognizes it's run on a PPC and executes the code in native PPC code. That is how Apple designed the interface and how TOS could also be modified.

Also, the system routines would be in native PPC code. Have you ever seen a PPC native program run? I have, and I have a PowerMAC (in addition to my ST) and it is unbelievably fast! Keep in mind, this processor can emulate, in software, a 25MHz 68030 easily (remember PC Ditto on your ST? Slowwww). Now, that's faster than a "native" running Falcon! So, if it is so fast emulating, then think how fast it is native code. The difference is phenominal.

Besides, now that Apple is slowly moving to the PPC line, they will use less and less 680x0 chips. That means Motorola will eventually have to discontinue development in the series (remember 6809?) as there will not be a market for them. Atari is not enough to give Motorola an incentive for further development and manufacturing.

Remember when the shift was made from 8 bit to 16 bit? There is a current market of 32 processors. However, the PPC (a 64bit CPU mind you) is the next step in technology. Soon the older designes will be phased out. Technology moves on. Sure, the 68060 is the state of the art for the 680x0 series, but I will bet it is the last of the line for that series. Motorola will just use its "integer unit 'CPU 32'" in their microcontroller line when all is said and done. Incedently, the 68060 uses the same technology as the PPC, but with a CISC based execution unit instead of a RISC one.

One last thing, what's wrong with combining a 68060 and a P603 (PPC) in the same motherboard???

Rich

: as you say..

Get a brain pal, Of course the 68000 has a 32 bit INTERNAL (let's read
carefully) data bus and a 16 bit EXTERNAL bus. Also, if you would have
actually read the paragraph you flamed, then you will see it says "16 bit
data bus and a 24 bit address bus". Hey stupid, that's exactly what it
has! Just because it has 32 bit internal data and address REGISTERS does
not mean it has a 32 bit BUS! The 68000 has a 16 bit data BUS INTERFACEJ
and a 24 bit ADDRESS BUS INTERFACE. So, pull your foot out and shut up.

Hi Christian,

> And what kind of player do I need to play sound's with the extension
> AIF?

Cubase Audio uses this format. It's the only Atari program that uses
this rather unusual extension, but I think you can use Zero-X to convert
it into more common formats.

Ha't

: Backwards-compatibility is crippling the computer industry in the 90's.

You mean kinda like recently when Bill Gates wrote Apple a letter TELLING them to stop manufacturing competing products? Besides, telling a company to not sell an emulation product would piss off Insignia (they make the Windows emulator). Besides, Apple has no legal basis or pull for trying to enforce a patent and copyright that they do not own, Atari owns the rights to TOS. Besides, development rights on Atari's version of GEM was signed over "lock-stock-and-barrel" by Steve Jobs right before they threw him out. This means Atari has always had a license to Apple's "look and feel". You see, Jobs had personal copyright to the original System and Finder "technology" and signed that technology over to Atari. This was done out of spite and anger towards the Apple executives (and so was starting the NeXT corporation). This is why Apple could not sue him for his NeXT graphical interface. He owned the original technology copyrights (in conjunction with Apple). This is why Atari has never been sued by Apple.

So don't worry, it's just blowing smoke up a tree.

No, just the other way round. The SLMC804 controller HAS a DMA-out connector,
but since it's a non-buffering device, it has to be FIRST in the chain.

I've been informed that there was a problem with the some of the drivers in
version 6, (could be it was only the midi driver), and there has been
an update of the faulty driver after version 6. I havnt' seen an update
though. And i still need to try version 6 as well. I'm using version 5 here
and the MFP is working just fine.

Sure is, cause i need a high DTE rate.

HM>
HM> CoNnect's Z-modem-bargraph looks like a fast peak-meter, when one uses EISDN
HM> at 64 kbit :-))) (>7500 cps for packed stuff ;-)
HM>

Thats what i need my high DTE rate for. I should be having my ISDN modem in
a few weeks now. Although i may have a small problem running bundle
channel 2x64Kbit.
Btw, i've just been informed that Hsmodem v.6 can go up to 230.000 on the
serial port. This is what i need for my ISDN.

I've got LGSelector, though I don't use it (Geneva again) but according to
the docs it is _definitely_ shareware; in fact Charles puts in quite a large
notice asking for people to tekae notice of the work that shareware authors
put in.
It's a toss-up (no pun intended) between LGS and Selectric for capability,
though Selectric also has a cpx to control/call/modify it.

>kit at the Falcon SCSI2) and connect the 'good SCSI'.

I tried it with an external cable & my own *working* SCSI drives: nada.
We'll try it without the SCSI-extension board next week. I hope the
fault is in the extension kit, because it's not really needed.

>>3. If you know any Atari dealer, who sells there SCSI-chips, please
>> let me know ASAP.
>
>You could try Best Electronics in USA, fax USA 408 243 8274.

Thanks, but I suppose (and hope) this is not needed any
more (see next chapter).

>Good luck, (I would send the machine back)

I just got a message from my friend that he managed to make a deal with
Akzente, that they'd send the parts and we'll send the repair bill to
them. Anyway, this is really annoying.

> Thanks in advance,

It's quite a good game, but asking for a registered copy, is no better
than the people on comp.sys.ibm.pc.games asking 'Could someone please
post me a copy of DOOM registered?' It's a blatant call for piracy.
Internet access isn't cheap these days. It's a surprise for anyone with
internet access claiming that they can't afford $7 for a game.
It's people like this who put the final nail in the coffin for the ST. I
released a game called Space Wars 2000 for the ST last year, and although
it was well received, I made the mistake of relying on the ST community's
honesty, and I released the registered version out front, and asked for
donations from people who enjoyed the game. Needless to say, I only got 2
registrations. I believe there are more than two people out there who
played the game for a length of time. I have since moved away from the ST
scene.

There is this wonderful thingy called "archie". Unfortunately, for archie
you need to know how your program/file is called. Then, you can ask
archie for the location.

So, the most important thing is *what's its name*, and location comes
only second.

If you have no idea about archie, drop me a mail.

Source record: 170698

Hi guys!

I have the following environment:

- Atari 520 ST+, Hypercache 16+, 2,5 Mb memory + TOS 2.06
SCSI Cd-Rom, Quantum drives
- Atari Falcon 030 (unmodified)
- Atari Stacy with 4 Mb + Mag!C
- PC 386 SX16 with 2 Mb & 250 Mb jumbo streamer (no SCSI).

What i want is connect this to eachother so i can use my streamer
in the PC for my backups. Currently the easyest thing i know is
make use of SmartNet, this small & cheap network can connect ST/TT/Falcon
to the PC using the printer port.

Who can tell me if there are other cheap & fast solutions so that i
can copy files to my PC or other ST without moving floppys?

GhostLink, Midi-Com & all other Midinetworks are not good & fast
enough. What i want is a fast link with a minimum of approx 50 Kb/s.

Buying ethernet cards or ANS or Bionet networks is to expensive, does
anyone have experiences with SmartNet 2.5 here?

Greetings,
Koos

They will continue to make 680x0 processors to satisfy what is and always has been their largest market - embedded systems. Apparently the 68000 is the best selling processor ever for this reason.

> out. Technology moves on. Sure, the 68060 is the state of the art for

The '186 was released, and it was used in PCs made by RM and bought by
lots of UK schools who then found they wouldn't run a lot of software
written for normal PCs. Some would run if you switched to a compatibility
mode which when wouldn't run RM's basic or logo (not that either was much
good).

[...]

: What it should have said was that all objects use character positions
: where possible. If you make sure everything is character snapped you will
: get a resource file that works in all resolutions but this limits you a
: lot and tends to result in ugly dialogues.

Not necassarily - I use character snap all the time with no problems.
It's only when you want to get fancy using lines a few pixels apart or
whatever that char snap is no good.
The problem I have is that any kind of bitimage (image,icon,cicon) will
come out all tall in medium rez. as rsrc_obfix() has no way of squishing
bitimages... To get around this, I draw two bitimages, and if I am in a
low vertical resolution (with 8pixel high fonts) I just point the ob_spec
field of the image to another image draw squashed.

Also remember that when you call rsrc_load() it automatically rsrc_obfix().

3169. 3D-Calc/ST-Club, England

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 21:27:44 UTC
From: tdcflcn@infinet.com
Message-ID: <3iqrog$b3h@horus.infinet.com>
Source record: 170609

I am looking for anyone from the ST_CLUB in England.

E-Mail address: stclub@cix.compulink.co.uk

I have just received an update to 3D-Calc from 2.?? to 3.04, and I
am having some problems with some functions.

Hisoft gave me this E-Mail address and informed me that they now support
3D-Calc, if this is true I hope they can help.

The problems I am having are as follows:

When an area is defined for "HIDE", "PROTECT", "ITALIC", etc. and the
"Set Attrabutes" is selected and "OK" is clicked, the area defined is
cleared of all data in the defined area, this is NOT GOOD! I use this
for my bookkeeping for a small business.

When you try to remove the any of the "Atrrabutes" the same thing
happens.

Also the "Merge file" functions does nothing!

Is there something I am doing wrong?
Is this the latest version?
Can I get an older version that WORKS!!?

Is there a program to convert 3D-Calc files to Lotus 123, any version?

I really need to get this corrected if possable or move the files to
another program if possable.

Please responed with E-Mail to the address below.

Thank you for any help.

Hi Christian,

> And what kind of player do I need to play sound's with the extension
> AIF?

Cubase Audio uses this format. It's the only Atari program that uses
this rather unusual extension, but I think you can use Zero-X to convert
it into more common formats.

3176. help with syslogd program

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 23:24:23 UTC
From: tkk@uclink2.berkeley.edu
Message-ID: <3ir2j7$b21@agate.berkeley.edu>
Source record: 170637
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've managed to set up Mint, MintNet, and X with Xterm a while back, but I had to hold off for a while. I'm trying to start a SLIP connection using DIP and I know I have to be running syslogd program to do this. I got syslogd and syslog.conf from the mintosbn.tgz file and stuck the syslog.conf file in the /etc directory and syslogd in the /bin directory. But now when I execute syslogd with say -d parameter, I get a bunch of path not found errors like:

syslogd: /var/adm/messages path not found
syslogd: /var/adm/lpd-errs: pathnot found

etc, etc.
How does one set up this syslogd program, and what about syslog.conf. In what directories do these have to be in? And do I need to change anything in syslog.conf?

tkk@uclink2.berkeley.edu

3177. Bad Computer test?

Newsgroup: comp.sys.atari.st
Date: 1995-02-26 23:48:34 UTC
From: egg@yolk.demon.co.uk
Message-ID: <793842514snz@yolk.demon.co.uk>
Source record: 170640

I ran a test on my Atari 520St, 4Meg ram the other day. Everything is running at 100% except for the Gemdos File which is running at 75%. Could it be, because I accidentally tried to load a Tos 2 disk which somebody gave me? When I did this it crashed. After that, I noticed the machine took a long time to boot up the main screen whenever I turned it on. So, I ran the test and was bitterly disappointed because my machine used to run at better than 100% (sob) What have I done? Is there anything I can do? :-(Suggestions greatly appreciated.

3181. Where's the Barracuda ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-27 00:19:28 UTC
From: nat@zumdick.rhein-main.de
Message-ID: <FB2AACUWUP@zumdick.rhein-main.de>
Source record: 170618

Anyone got any new info on the Barracuda 040 board by Wizztronics ?
I have been waiting now one year to get an accelerator board.
OverScan is apparently incapable of producing one (Afterburner),
but I have still hopes for the Wizztronics solution.

Actually does anyone know why it is so complicated to produce
a 040 board for the Falcon ? I would naively assume that one puts
a CPU with local RAM (keeping the original RAM as 'ST'-Ram) on a small
board, slows access to the Falcon bus to the piddling 16 Mhz and
that's it. (Yup I am no hardware expert...). And all this (w/o the RAM)
shouldn't cost more than 1000.-DM (or $500).

Nat!

Give me a break. I'm sure that at least half of PC users don't know about all that. The most they can do is type "memmaker" from the DOS prompt and hope that DOS6 takes care of them. I've had it create a CONFIG.SYS that locks up the machine on many occasions. Sometimes it's taken nme a few to figure out why....like the SCSI driver or Enhanced IDE driver has to go first. Memmaker doesn't know this...so memmaker can't be used. In other words, loading high that driver, and ANSI.SYS, and CD-ROM BUS driver, and MSCDEX driver, and MOUSE driver, and HIMEM.SYS, and EMM386.EXE must all be loaded according to how I have typed up my autoexec.bat/config.sys files. No, I am not new to this. I don't have to be to know that it SUCKS. Think about someone you know who is not "computer literate" - like your mother or a relative. They can click a mouse, which is all they should be able to do to run a computer. The cannot (and in most cases, don't feel they should have to) get into the practice of editing CONFIG.SYS files and resolving conflicts.

They should just have to operate the power switch, mouse, and keyboard for entering data within their application. THIS IS NOT THE CASE. Juggling around the 640K is NOT EASY, and just because someone doesn't want to do it, THEY ARE NOT A COMPLETE MORON. I'd say the MORON is the at the center of the folks who have required this tedious process to continue for a decade and a half.

>
> You think all the millions of people in the world who use PCs spend all their
> time messing with configuration files..? Yeah, right...

No... (1) Millions of people use a system with as a dedicated machine (word processor, etc) that comes up with a batch file or easy menu to guide them to their application. God help them when it comes time to change the configuration, however. (2) Millions of others "call the techie" to come over and do things for them. No telling how many "techie" jobs will be lost when something (PowerPC of the future running GUI of choice) fixes all that. (3) Millions of others have the ability to juggle device drivers and modify .SYS files....but that doesn't mean they have to like it, or that #1 and #2 can be called "MORONS."

> IRQs and tinker with configuration files.

Gasp!!!! In your first above paragraph, you reduce the most difficult process of installing a PC card to "adjust everything to mathc the new card"...and then get on doing what you do..... HA HA!!!! And in your immediately-following paragraph, finally state the WHOLE ENCHILADA of troubles changing IRQs and modyfing config files.....and DISMISS the whole thing (which you called "adjusting everything to match the new card") as if it was some complete absurdity!!!! Hey man...if it wasn't for doing those very things there wouldn't be a problem to begin with!!! You wouldn't need to "adjust everything to match the new card." I don't see how you could make those related, contradictory posts, and not notice it.

Have you ever tried to install a network card in a system that has a Sound Blaster and scanner with a bus interface card, and other devices? "adjusting everything to match the new card" (as you so eloquently put it), is a real BEAR, in many cases.

>
> It makes for cute 'net converstation, but has nothing to do with the way the
> real world works...

You must be talking about easily "adjusting everything to match the new card" here.....that certainly is cute 'net conversaion, but is SUUUUUUURE ain't how things work in the real world....if you're talking PC. On the other hand, if you can operate a toaster oven or hook up a TV antenna, you can network a Mac and add a scanner.

I ported NetPBM (I think it was one version behind the latest, which is
March '94) to MiNT a while back; I'd do a much nicer version (a "merged"
binary, if you've read the NetPBM docs) if I had more RAM. Shared
libraries would be nice, too.

Anway, my port of NetPBM is on atari.archive.umich.edu and mirrors in
Mint/Graphics/Netpbm/* or something like that. There's plain 68k
versions, and 680x0 (x >= 2) w/FPU if I remember correctly.

xmkmf isn't really needed; you can usually create a proper Makefile by
hand. I know this because our systems at work are not set up properly,
and xmkmf fails miserably.

Guys, quit it. This flame war has been raging in comp.sys.unix.advocacy
for about six months now. It's basically come down to everyone agreeing
that:

1) CLI-only systems are hard to use unless you're very experienced but
allow you to do some complex actions easily.

2) GUI-only systems are very easy to learn but can be awkward for
complex actions.

3) The best system is one with *both* (witness the existance of
scripting software for the Mac, such as AppleScript and Frontier). This
gives the ease-of-use of a GUI with the power of a CLI where needed.

>Maybe it's me being stupid, but I cannot for the life of me see the point of
>having an intuitive, logical, graphical interface, then dropping it in
>favour of an awkward command line system.

rm -f `find / -name *.bak -print`

That will easily destroy *.bak (usually backup files of some sort) on
the system under UNIX, or my OS/2 box at work, or my ST. That operation
is not as easy under GUIs. Granted, this can also be done under a
well-designed GUI (like the Mac), but under a badly-designed one (ie,
Windows) it's less than obvious.

Being able to do it both ways would be ideal. With the GUI method, anyone could do it, and with a shell, you could put it in a script (maybe as part of a script to clean up your system and free up some disk space before doing a backup).

>I have to admit to being a little confused by terminology here, too. I
>always thought that a shell was a device to make the launching of programs a

CLI is a TLA (Three-Letter Acronym) for Command-Line Interface, aka a shell.

>As for the Mac Fileselector, I can't comment as I've never moved in such
>circles ;-)

Much better designed than the one in Windows or OS/2. I prefer the fileselector on the Atari, which has the drawback of being unable to select a directory instead of a file; this isn't a common operation though.

>However, the original point I made still stands; why do we
>insist that we are improving the interface by going backwards? I'll bring

The point is that it's *not* going backwards; adding a shell (or scriptability) to a GUI system makes it much more flexible for the skilled power-user. Otherwise, you reach a point where the GUI is limiting you.

>it closer with another analogy. When was the last time you bought a car
>with a starting handle, manual ignition advance, and hand pumped
>lubrication? To use as Transport, not as a hobby, that is. Same with

When was the last time you bought a mouse-controlled car? :-)

>computers. The computer is a device to make certain activities easier,
>quicker and in some cases viable; why should the user be FORCED to disable
>half of it's labour saving facilities because users of another make don't
>have them? It's like saying you must take the central locking system and
>auto transmission off of your Mercedes saloon because Ford trucks don't use
>it.

You seem to think that it's one or the other, CLI or GUI. To refute that, just look at a UNIX system running X... it's a GUI that's usually used to run xterm, a little window with a shell in it. Then again, all the applications are horrendous... ;-) On the other hand, look at NEXTSTEP, perhaps the best GUI available today; it's also got CLI/shell windows (called Terminal). Best of both worlds.

>If you want to use a CLI environment because you find it easier, fine; but
>why should I (and everyone else) be required to follow suit? "Because it's
>done that way" is not an answer either. If that were the case we'd still be
>writing on stone tablets with flint.

One-or-the-other is not good enough, otherwise you wouldn't find shells
for GUI systems and GUIs for text-only systems (like UNIX).

Source record: 170623

After talking to Steve Taylor tonight, I was just wondering if anyone would be interested in some sort of Atari Conference here in the UK. I'm not really talking about a show, more a meet where people could turn up, see other people, have a look around other people's systems, maybe display their own if they wanted to and possibly have a few guest speakers attending. Obviously I'd say have it Manchester since I live their but I have a feeling the general trend would be based further south although I could be wrong.

Would anyone be interested? Like I say, it's just something Steve mentioned and I thought it would be quite good (better than 2 hours at a Gasteiner show saying 'oh, Hisoft ain't here...' anyway ;@)).

Followup refusals, arguments, suggestions and stuff to here ;-).

Flames to me ;-).

Cheers,

Paul.

Dunno about you, but I ain't never seen a Mega STe(f). We were discussing
an STf or fm as I remember. It was also wrong because some STf and fm
models had only a 360k drive. Ta to whoever pointed that one out, too; I
have to admit I always thought the 360k was only fitted to STfs and that the
fm had 720k as standard - but, never having checked every one, I _could_ just
be wrong...:-)
I put it the way I did because I (and others I have met) consider the MegaST
range to be a tad off the mainstream "single box" ST (yeah, I know the
earliest ones had a separate drive)

3196. FORSALE: Jaguar System

Newsgroup: comp.sys.atari.st
Date: 1995-02-27 10:15:17 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3is8nl$cmp@news2.delphi.com>
Source record: 170632

*** Jaguar System for sale ***

I have an extra Jaguar System for sale. I bought it to play networked games, but they don't seem to be coming out very fast. So instead of sitting on it, I've decided to let somebody else enjoy it.

Here is what I have for sale:

Jaguar core system (RF box, controller, AC adapter)
Second Controller
Cybermorph
Trevor McFur in Crescent Galaxy
Raiden

I have the boxes and manuals for everything except Raiden (manual only).

Price? $215 shipped to your door.

I also might sell Zool2 and an S-video cable. Add $25 for Zool2 and $12 for the cable.

Please e-mail me if you are interested.

Dom

: Al
: (agoold@cix.compulink.co.uk)

I have a Mega STe as well, the only software I've really had any
trouble with are ones that are compiled in some way or another...I guess
the compiling algorithms aren't quite compatible or something...other
than that, mostly just demos don't work. (Which is, once again, probably
because of the above problem). So in the end, try to see if it's
compiled. Some of the older compilers do not work and do strange things
to your machine.

Does anyone know a zmodem program for the ST that works properly with
Unix sz/rz AND under MiNT? I'm using XYZ now, which works terrifically
well with Unix sz/rz, but not under MiNT.

Please reply by private email.

Uh, that's the opposite to what the subject says actually, but I guess
you mean what you write on the line above.

> Mega ST without them looking like crap! I do have a really nice GIF viewer
> that allows upto 4096 in a HAM mode. So if I can convert them, I will
> be somewhat happier.

MGIF 4.4 can load JPEGs and save GIFs among lots of other things. It
may not be quite as fast as some other programs at those two operations,
but it's FreeWare.
The latest beta version can be found at my ftp site, rand.thn.htu.se.
(It should have been in general release by now, but I've not had much free
time lately.)

1)...It's not as difficult as you make it sound, and

2)...Once it's set up there's no reason to play with it incessantly.

The typical "giggle HA HA HA" description of PC users is that they're constantly having to tinker with CONFIG.SYS and AUTOEXEC.BAT files...

That's stupid... you set it up once and leave it alone.

By the way, have you ever had to explain to someone why their Atari ST won't boot because an AUTO file program is in the wrong order..?

It seems computers are computers, no matter what brand name is on the outside of the case...

Well, let me tell you something here....

First of all, the Medusa T60 (with 68060 processor) was presented and demoed on the ProTOS Atari-messe in Bonn-Hennef in Germany late November. So it`s VERY likely to find a Medusa with a 68060 !!

One of my friends was there and tried the Medusa T60, by the way it`s violently FAST!! :-) It runs at 100 MIPS at 32/64 Mhz.

Second I have a issue of the "MC" magazine, a german magazine, where it contains a 7 page article about the 68060. I remember that the issue is from june or july 1994.

The 68060 was released last year!!!!!!!!!!!!!!!!!!!

Anyway where are you getting your "news" from ???

Keep Cool and Flying...

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 27/2/95
~~~~ ~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

4th Update
~~~ ~~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

News and Changes
~~~~ ~~~ ~~~~~~~

Well since the original description a lot has happened. I'm now involved in
several projects, and submit work to several Internet and diskmag sources for
inclusion. I have also officially took over the maintenance of the Atari FTP
list from Hallvard Tangeraas of which there have been a couple of updates.

New items in this document since the last copy will be marked with **, updates
will be marked with a U. All new items are also listed below according to the
date they were added.
```

The new items this month are:

27/2/95 -- Towers II : Plight of the Stargazer Update!
27/2/95 -- Falcon Owners Group Magazine No.8.
23/2/95 -- Atari FTP List Update
22/2/95 -- HENSA Atari TOS Newsletter Volume 8. No.4
22/2/95 -- HENSA Atari Falcon Newsletter Volume 8. No.2
22/2/95 -- HENSA Atari MiNT Newsletter Volume 8. No.2
22/2/95 -- MIDI Grid Review by Andy Curtis
8/2/95 -- Utopus Two player shootem' up (STE) 231K
8/2/95 -- Downloadable files in Falcon/ST sections now have file sizes listed
7/2/95 -- Hyper Image pages link (contains Hover Hunter news)
7/2/95 -- Mail to me directly using this link
7/2/95 -- New inlined Atari logo for Web pages by Frank Charlton
7/2/95 -- AEO Newsletter Volume 4. Issue.2 in text and ZIP format
6/2/95 -- Pinball Dreams and Llama Zap Falcon News
6/2/95 -- News and Announcements section added
6/2/95 -- HENSA Atari TOS Newsletter Volume 8. No.3
2/2/95 -- Lynx FAQ updated
2/2/95 -- Jaquar FAQ updated
2/2/95 -- Connect Review by Frank Charlton
2/2/95 -- Zero 5 Review by Frank Charlton
1/2/95 -- Atari FTP List Update
31/1/95 -- AtariNOS FAQ
30/1/95 -- CAIN Newsletter Volume 2. No.1

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular

piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.

==========

U What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. It is now possible to mail me directly from the Web pages, special thanks also to Frank Charlton for the new Atari Logo. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.
- Toad Computers Pages. Stockiest and retailer of many Atari goods.
- ST Format Pages. Information and previews of ST Format issues.
**Hyper Image Pages. Contains Hover Hunter Jaguar news.

This section will have a page dedicated to it this month as over 30 new Atari related links are added.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

U Atari FTP List by Mark Stephen Smith (essential for the latest news on who provides Atari FTP sites).
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:
~~~~~

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.
- MiNTNet FAQ by Christer Gustavsson. Everything you wanted to know about MiNTNet.
**AtariNOS FAQ by Frank Charlton. Answered questions and information on NOS.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them. These have been re-organised to make it easier to keep track of. At the moment there is:

U CAIN Newsletter containing the latest Atari news.
U HENSA Newsletter containing the latest updates to the HENSA Atari archive.
U AEO Newsletter containing the latest Atari news.

Newsgroups
~~~~~~~~~~

Atari related newsgroups. Send updates. The currently supported news are:

comp.binaries.atari.st
comp.sys.atari.advocacy
comp.sys.atari.announce
comp.sys.atari.st
comp.sys.atari.st.tech
comp.sys.atari.programmer
rec.games.video.atari
alt.games.lynx

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****
~~~~~~~~~

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)
- Edith Professional review by Frank Charlton (ST Format)
- MagiC review by Andy Curtis (ST Format)
- Stello v2 review by Mark Stephen Smith (Myself)
- Sportster Modem review by Frank Charlton (ST Format)
- Storm Tracker review by Andy Curtis (ST Format)
**Connect review by Frank Charlton (ST Format)
**Zero 5 review by Frank Charlton (ST Format)
**MIDI Grid review by Andy Curtis (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (finishing review of Apex Media for the Falcon). This section is now growing well.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

**News and Announcements Pages
~~~~ ~~~ ~~~~~~~~~~~~~ ~~~~~

Latest Atari news, and announcements from the Atari World. Currently contains the following:

**Universal Virus Killer Book Announcement

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. Unfortunately the way the logs are now stored prevent me from calculating the number of accesses to these pages in the future.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.
~~~~~~~

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently
this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be
small descriptions or full features with pictures. At the moment there is:

**Pinball Dreams and Llama Zap News.
- Apex News. This contains some information I got on Apex Media for the Falcon
when I spoke to Douglas Little on the phone a few weeks back. Not very
detailed unfortunately, but I'm waiting on my copy of Apex to give a full
review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a
picture. Only at an early stage of development, if I hear more it will go in
here.
- Towers II : Plight of the Stargazer. Pictures and description of this great
looking Falcon only sequel to Towers. Expect the demo soon.
**Towers II : Plight of the Stargazer Update! The latest news on developments.
U Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of
information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.
- Falcon Specifications and Information compiled by Rod McCall.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to
be done with updates here. All files now list there size so you can see how large they are
before downloading. At the moment the following software is
included, with more to come:

- Super Bomber Man (freeware)
- Play MPEG v0.70 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.
U FOG issue 8 diskmagazine for Falcon.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions
which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).
- FOG issue 7 diskmagazine for Falcon.
- FOG issue 6 diskmagazine for Falcon.

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned
Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are
small descriptions or full features with pictures. At the moment there is:

U Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major
revisions to be done with updates. All files now list there size so you can see
how large they are before downloading. At the moment the following software is
included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

**Utopus. Two player shootem' up (STE only).
- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust Klax
Kungfood Lemmings Lynx Casino
Malibu Bikini Volleyball Ms.Pac-Man
NFL Football Ninja Gaiden
Ninja Gaiden III : The Ancient Shop of Doom

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

U Lynx FAQ
- Lynx Tips and Tricks

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~

Currently empty.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar.

- Jaguar CD Specifications
- Rebellion Development News
- Sinister Developments News
- Sensible Soccer News
- Coming Soon!
- Hand Made Software News

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph
Aliens vs Predator Trevor McFur in Cresent Galaxy
Brutal Sports Football Dragon: The Bruce Lee Story
Wolfenstein 3D Checkered Flag

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

U Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ update for Jaguar

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Christian Svensson

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I have introduced an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, this section will be getting it's own dedicated page as over 30 new Atari related links are to be included this month. There will be more newsletters, documents, updates to the FAQ's.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials. Also Claus J. Pedersen (Stello author), Bob Brodie (former Atari employee) and Steven Davies have all offered to support these pages with contributions in the future.

Please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

3214. Re: ST Clock wanted.

Newsgroup: comp.sys.atari.st
Date: 1995-02-27 15:19:07 UTC
From: pwal@lfi.uni-hannover.de
Message-ID: <1995Feb27.151907.757@newsserver.rrzn.uni-hannover.de>
Source record: 170580

I have a real time clock for ATARI ST, it is compatible to the one in the MEGA ST, so it is recognized (an of course used) by TOSses >=1.02.
It is placed under a ROM and two cables are clipsed on legs of the CPU.
There is also software to set the Time if you`re using 1.0 (but I think no one uses 1.0 nowadays).

Take care, Phil

3215. Re: ZORG & ICD

Newsgroup: comp.sys.atari.st
Date: 1995-02-27 15:21:26 UTC

writes:>>When I try to use ZORG to check my hard disk it flies though loads of
>>files and then suddenly comes up with error 15 - any ideas. I am using ICD
>>Link II with a quantum 240MB hard disk and I am checking normal 32MB
>>partitions.

>I am the author of ZORG. What exaclty was the message ? (I don't remember
>what is error 15).

>Which version did you used ? The last one is 1.41 and you can get it
>from ftp.cnam.fr:/pub/Atari/Disk/zorg_141.lzh

>The next version will come soon (I think in wome days or weeks).

The error is XBIOS -15 (Unkown Device). I have tried telling ZORG that it is
an ASCI and SCSI drive, however I am not sure that the number of sectors is
correct.

: >but I'm going to ask anyway. We've had our 1040STf for a long time now,
: >and I quite enjoy using it. Recently, I found a demo for a really cool
: >game called Bio Hazard based on the Alien movies. Needless to say, I was
: >impressed. Trouble is, I can't afford to register it. So, if some kind
: >soul out there has a registered version and would care to send it to me,
: >I'd be forever in their debt. Also, if there are similar games, I'd be
: >interested in finding out about them...
: > Thanks in advance,

: It's quite a good game, but asking for a registered copy, is no better
: than the people on comp.sys.ibm.pc.games asking 'Could someone please
: post me a copy of DOOM registered?' It's a blatant call for piracy.
: Internet access isn't cheap these days. It's a surprise for anyone with
: internet access claiming that they can't afford $7 for a game.
: It's people like this who put the final nail in the coffin for the ST. I
: released a game called Space Wars 2000 for the ST last year, and although
: it was well received, I made the mistake of relying on the ST community's
: honesty, and I released the registered version out front, and asked for
: donations from people who enjoyed the game. Needless to say, I only got 2
: registrations. I believe there are more than two people out there who
: played the game for a length of time. I have since moved away from the ST
: scene.
I'm a university student, so my internet access is free. I can't afford
to feed myself, let alone register a game. ($7? Hardly, translates to
about $20+ from canada to the Uk when all's said and done). I don't have
excess cash. I don't smoke and I don't drink, and even then I have no
cash. Hence the request.

STalker's VT-100 emulation is much slower (and poorer) than CoNnect's. Besides, when comparing the prises, CoNnect would be my choice.

>from the Audio CD and save it as a sample file?

I'm no expert on CD-ROM drives, but I don't really think this is possible with the current drives out there. I am not sure, but I believe that with audio CDs, you can control the CD-ROM player and tell it what to play or to skip, etc, but it won't actually read the music on the CD as data. That's why, for example, you can't see a directory of a audio CD, because it is not treated the same way as a computer data CD. There is nothing in theory to prevent the two formats from overlapping, such that you could actually look at the contents of a song on a music CD, but I don't think you can do it now.

Anyone who has any more information, feel free to correct me. :)

->
-> Daniel Cohen

Hi Daniel. I ended up purchasing the HL 660, the 600 dpi model for $800
plus taxes (Canada). It is working fine and dandy, but will work even
better when I get my hands on the proper printer driver for it...
the HP4 p. driver! That way, I can select whether I want 300 or 600
dpi, plus some other useful selections.

Thanks for your remarks.

Er... the Macintosh Performa 475 (same as Quadra 605, LC475, etc) uses
a 25MHz 68LC040 (conservatively 3-5 times faster than a 16MHz 030).
Perhaps you were thinking of the Performa 550 which has a 33MHz 030?

But regardless of speed, it still ain't an Atari, right? :)

Well, you _could_ be right, Barry, but judging from the way the "twonk" :)
posted his message (anticipating flames) asking for a registered copy of
the game and from the reaction from the author of Bio Hazard, I'd say I
was pretty well spot on.

But yes, I concede that I do tend to 'jump the gun' when it comes to
software piracy. Most developers I know do. ;-)

What? Nonsense. Yat is 100 % correct with his statement.

The 050 doesn't exist. The development of the 060 seemed more promising and so
the 68050 was dumped during early developement. At least as far as my infos ar
concerned.

(Sorry I replied to the quoted part in your quoted mail. Didn't see the
original post.)

> Not that I expect any kind of massive release for the 060 since Atari
>clones are the only possible market for them that I'm aware of, but I have not

Another WHAT? That's nonsense, too.

The 68060 will be used for high-speed industrial controllers, VME-board-
computers, and this sort of installations.

The 060 clone market hardly exists and those figures won't even show after the
decimal point.

There's one other; it's called Janus, a hardware emulator that
you plug into one of your PC's card slots. It uses it's own memory
thus making it totally independent of your PC's configuration.

3238. Burning Illusion demo

Newsgroup: comp.sys.atari.st
Date: 1995-02-27 19:37:51 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950227113200.5144D-100000@PEAK.ORG>
Source record: 170533

I downloaded the Burning Illusion demo (circa 1992).

PEOPLE PEOPLE PEOPLE!!!! LET ME TELL YOU THAT IS FABULOUS STUFF!!!!!!!

I stared at my ST screen in complete (utter!) disbelief. That demo looks like it was running on a fast 486 with VGA or better.... not a 10-yr old, 512K 520ST.

PLEASE!!!!! Will you guys who have been at this a long time, tell me what other demos are out there like that? I can't wait to show the PC nut roomate when he gets back with his PC...heh... Such amazing graphics from my "old, slow" computer will sure be a surprise. LONG LIVE the ST!!!

That demo made my ST do something that I suspected it could do: Make me smile from ear to ear, for several minutes....and maintain enthusiasm for the line. That, it certainly did.

IF YOU HAVEN'T SEEN THE "BURNING ILLUSION" DEMO, YOU **HAVE** TO GET IT!!

Thanks... (I know I'm a couple years late on this....forgive me for being so excited).

James

There is a whole realtime world out there using 680x0s on VME boards and such.
We use Force CPU-40s (68040) VME boards. So there will still be a demand
for Moto processors. However, HP is putting out these PA-RISC VME boards
that are 2x as powerful as an Onyx for under $10,000 (CPU-40s go for
around $5,000), so that could put a dent in the Moto VME market.

I still am baffled by the difference in demos between the ST and the
PC's. I've recently purchased a 486/66 with a great video card, PCI bus,
write back cache, all the fast stuff. Then I watch demos on the PC that
aren't even as good as the old ST ones.

I don't know what it is exactly. Either demos on the PC are written in
Turbo Pascal, or they suffer the same old Backwards Compatibility
Problem that plagues the PC world... I know it isn't the hardware :-).

So even if my ST is second place in overall performance, I'll have to
keep it around for demos anyway :-)

What makes you think more than 16 people are using your program Eric ?

Let's get one thing straight. Crippleware is and can not ever be shareware.
Shareware is a fully working program without any limits, were you just
trust the users that they'll registre. Crippleware got limits.

The 80186 actually made it into quite a few things. Mainly as a controller on PC expansion boards - though ISTR that Orchard(?) did a PC upgrade with one. I daresay that its found in a lot of dedicated computer solutions as well.

Roland.

To: gloganwr@is.dal.ca

Hi Gabriel,

> I'll probably get flamed to the Nth degree for asking for a
> registered shareware game,..

You should!

> (I've found Atari users much more defensive over that)...

We *know* the value of explosive new software. We care for our cool computers,
and are anxious to support authors of fresh software!

Aren't we, fellas?

> Trouble is, I can't afford to register it. So, if some kind soul out
> there has a registered version and would care to send it to me, I'd
> be forever in their debt.

Wrong! You'd be forever in debt to the creator of the game!

What I *could* advise you to do, is to send the author a note explaining your
situation, and ask him what he thinks. He *could* kick your ass, or
he *could* be a loving and understanding person who *gives* you a copy,
and expects you to be forever his friend.

I'm sure there's something you could give in return: some home made
piccies, some music (MIDI files) you have created yourself, some beta testing
servicies...

But do it the right way!

I *hate* the thought of wonderful software being spread the way you
describe so much that I'm seriously considering *giving* you a registered
version as a *gift* and paying the author myself!

There we are: *attitude!* Keep up the attitude folks!

And please remember: *No computer is any better than the software written *for
it. Support shareware authors - don't kill the urge!*

Yours sincerely

Actually, it does emulate the Atari ST entirely in software. The hardware portion is nothing more than a ROM reader to hold the ROMS. Upon booting the virtual ST, the ROMS are read into RAM, and then all emulation takes place in software. There are NO chips of any kind on the board.

Actually it is very nice, as you move to a faster PC, you get a faster Gemulated Atari ST. BTW, I'm running my Gemulator on a 486/33DX at 100% speed of a stock ST.

Howdy, gang. I've pretty much finished a spiffy new MOD player. It runs as a PRG or ACC, has the _coolest_ 3D look interface, and (coolest of all) automatically scans any floppy you put in the drive and loads any .MODs it contains with no need for the user to even have the ACC open. Unfortuneately I have run into one /small/ problem.

I have _NO_ idea how to play a .MOD. Oops?

So, anyways, can anyone direct me to PD or at least cheap DSP .MODS playing source? Thanks.

Hmm...

] That didn't come across well. I bought the Geneva/NeoDesk4 combination and
] am having some small problems with windows bleeding through and how to
] configure some programs to only use small amounts of memory without
] automatically running them and putting them to sleep.(A configure file woul
] be ideal.) Is anyone beside me running this combination? I also am having
] trouble with Stalker bombing out while doing a file transfer in the
] background and accessing the hard disk in the foreground. There must be a
] way to time events so the two events don't run into one another. Thanks for
] any help.

Make sure you have the latest version of STalker, as it patches all sorts
of problems with Neodesk 4 and Geneva. I've always got Neodesk 4 and
Geneva installed. To limit the memory of a program just use Task-Manager
and install it with "Limit memory to [x]" set to whatever. Basically,
the online help for Taskman (and the manual) explain the settings for
the various problems, including window-"bleeding". Have a look at them.

>card"...and then get on doing what you do..... HA HA!!!! And in your
>immediately-following paragraph, finally state the WHOLE ENCHILADA of
>troubles changing IRQs and modyfing config files.....and DISMISS the
>whole thing (which you called "adjusting everything to match the new
>card") as if it was some complete absurdity!!!! Hey man...if it wasn't
>for doing those very things there wouldn't be a problem to begin with!!!
>You wouldn't need to "adjust everything to match the new card." I don't
>see how you could make those related, contradictory posts, and not notice it.

"Hey man"... you seem to be the one having all the big problems, not me..

Maybe you shouldn't be messing around with all this stuff if it's so hard
for you..?

I don't see anything contradictory in anything I posted.. I said you install
the hardware and make any changes necessary, then go ahead and use the new
card... nothing contradictory there.

Let me ask you this:
Have you ever installed a network card in an Atari ST..?
Have you ever installed a 16 bit stereo wave table synthesis card in an ST..?
Have you ever installed a SuperVGA accellerator card in an ST..?

Pretty easy to say there are no confilcts or configuration problems there, eh?

Now let me ask this:

Have you ever tried to create a working ASSIGN.SYS file..?
Have you ever tried to explain to a frustrated Atari owner how to create one?

Keep in mind the ST has fewer problems because the ST is a simpler system.
That doesn't mean it has none...

Computers are just computers. The more complex the system, the more complex
the problems.

Roger, I've found XLATOR2 to be the quickest..It's damn fast! MULTLAN2 is useless and GER2EN30 is too damn slow. The guy who wrote GER2EN30 also wrote another program similar to MULTLAN but he holds back on the dictionaries until you register and it's still too damn slow. I'm not aware of RUFTRADE though...(anybody else?!) I have however taken the dictionaries from all the programs and converted them all to work with XLATOR2. I've got a nice 30,000 word dictionary now. It took forever but if anybody is interested I'll let you have it in trade for something else interesting or $5 US.

In article <m0rinLM-0005uLC@black.csi.cam.ac.uk>, Mark Baker wrote:

] BTW programs compiled to use the FPU of the Falcon or TT won't work on
] that of the MST(E) and vice versa as the programming interface is totally
] different - the '030 has fpu instructions such as fmove, fmul etc, whereas
] to use it on the MST(E) you have to set various registers.

That's nearly right. The 68030 however, does not have fpu instructions
itself, but when it decodes the opcode of them, this causes an external pin
to activate the fpu which then acts upon the instruction. The 68030 will
then either wait for the instruction to be executed (if 68881) or carry on
until it needs the result (if 68882).
When the fpu is used with a 68000, the floating point instructions
cause a trap. The trap exception must then send the instruction to the
appropriate address that the fpu is mapped to, and then return the result
to the calling program.

This is probably an easy one for someone out there. I've got a brand new CTX 14 inch SVGA monitor, and I've hooked it up to my Falcon with a SVGA adaptor from Ladbroke Computing. When I turn everything on, the display is wrapped across the monitor screen twice. The Falcon is obviously sending the signal at half the speed it should. Has anyone got any clues? Can I fix it with a software driver, or have I got to send my Falcon back to Atari for the third time (and wait another six weeks on top of the twelve weeks it's already been at Atari in Holland being repaired)?

TIA, Paul Hills

Hey man it's quite possible because with Gemulator you run TOS prgs on PCs.
But The PowerPc it's compatible (see The PowerMac 6601 DOS Compatible): the
PowerPc was made to run 68xxx and x86 codes.
But for this rumour i heard too that atari made a project based on powerPc
why not ? Atari works with IBM for the jag and IBM works with mortorola .

Yes, from my personal experience with Gasteiner they appear to
have something of an attitude problem. Asking about various products,
I felt that they weren't really interested in even trying to get hold
of things they didn't have in stock, or selling at all (??) - and *why*
in their advert in the latest STF do they have the logo of ATARI INSIDE
magazine across the top ? Do they sell it ? Or are they using it because
their own logo isn't good enough ?

I was on their side when Sega threatened them with court action over the
name MEGADRIVE, but now I couldn't care less because they obviously don't.
For instance, a few months ago I phoned to order an STE for a friend. It
was clearly advertised for 199 pounds. Now, I am not blind to the fact that
Atari don't make them anymore, but the lady on the phone told me so, and
that they didn't have any in stock, and didn't seem like they were going
to try and get me one. She sounded like she wanted to hang up as soon as
possible to do something more interesting or important than serving a
(potential) customer.

From now I'll make all hardware purchases from System Solutions, because
I know I will get excellent service and backup. I've met both companies
at shows, and SS by far demonstrate a healthier enthusiasm as an Atari dealer.

: Do you really think Motorola would give Medusa Computer Systems a buggy PROTOTYPE of a processor to use in a computer-design ???????????

: Come on - get real, will you ??

: Keep Cool and Flying...

: ChainXOR...

I happen to live near a Motorola office, and I have gone there quite frequently to get as much information as possible (heck I have every book published by them!), and the 060 has been in perfect working order since at least January 1994. Prototypes have been issued regularly. Large scale orders have been issued for them since mid' 1994. It is a fine processor as it is basically a PPC design with a CISC execution unit instead of a RISC one. The pipeline and speed is basically the same. Sure, they are different, but technology was shared for the 060. It is a litteral monster of a CPU.

A nice little 040 to 060 adapter board is available for prototyping in existing 040 systems. It includes the necessary PALs for signal translation along with the 5 to 3.3v translation circuitry. It is selling like hotcakes. It's a plug'n'play device.

It is far superior to any CISC processor (including Pentium - aka: random number generator). It's "moderate" 50MHz speed still makes it outperform a 90MHz Pentium. Sure, the 680x0 line is old, but it will be around for

at least five more years. It will, however, fade away... Enjoy it while it's here. Those of you with the cash for a Medusa, I envy you!

The problem with Geneva is that it is only a multitasking AES. It only multitasks GEM applications. It does not multitask GEMDOS or BIOS routines. They are still the "old" single-tasking routines. Therefore, if two different programs wish to use the core system resources (disks, etc.), then they are going to make TOS very displeased.

My siggestion to you is to investigate acquiring MagiC! or MultiTOS. They are fully GEM and TOS multitaskable. They will behave much better with your background program than GENEVA. Another solution would be to install MiNT before running Geneva, but I have no idea if Geneva will work with it. MiNT is available on most ftp sights. MiNT is the multitasking kernal that is part of the MultiTOS package, but without the AES extension. Since Geneva is an AES, then it is logical to assume it will work with MiNT. However, I have no idea as to compatibility with Geneva and MiNT.

Good luck!

The 68040 is vastly different to a 68030 in terms of hardware interfacing. It is a difficult process getting an 030 to work in an 040 design. The bus signals are different and the hardware required to use them is different. Much of the decoding hardware of the 030 is no longer available in the 040. You may call this backward, but it actually makes the 040 design more flexible for different 040 uses. However, Motorola has published schematics for a bus "translator" board for it to use in the 040 design.

With this help from Motorola, you may not see how it's so difficult. However, this translator disables burst mode accesses and that does limit the 040 tremendously. Perhaps these companies are trying to overcome that limitation and yet have it cooporate with the Falcon bus. It sounds like a hard job.

I found a program inside a German telecom package called SZ.PRG and
RZ.PRG. They are well behaved GEM Zmodem download programs that are fast
and very compatible. Yes, XYZ is great, but it doesn't like MagiC!
either. These programs work beautifully. Their interface is easy,
although minorly limited.

The german package was called "STARCALL". The sofware was too confusing
for me, but the Zmodem programs are excellent. It seems they are
shareware programs that the Starcall guy uses.

I have no idea where to find it as I downloaded the package off of a
local BBS. I am sure Archie will locate it for you. I have seem it around.

OK, why the hell do people bother with these damn requests for
illegal copies of registered shareware? I've noticed that in the DOS
world, people don't seem as concerned about ripping of Huge companies
like MS, but shareware products are generally by private authors. Not
too make a certain other gentleman here the asshole, but *I* am a college
student, too, and *I* work my ass off to pay for *my* food and rent, but
I'll be damned if I'm going to STEAL software from an author because I am
TOO DAMNED LAZY TO GET OFF MY ASS and show the dignity, respect, and common
courtesy of treating people like I would want to be treated. I don't
know much about programming, and the shareware authors out there provide
many good programs. If I use one, you can be sure *I* will pay for it.
I think everyone here would agree that THIEVES ARE NOT WELCOME in this
group. (BTW, sorry about the yelling)

I have done similar conversions on a couple of occasions. Two further possibilities are:-

1. Redacteur3 for the Atari allows you to save files in WP (& MSWord) formats.
2. Timeworks on the PC allows you to import FWP files directly (you can then use the clipboard to cut & paste them in to any other Windows word processor).

Hope this is of use.

Uniterm will do this if you edit your keyboard-interpretation. There is a
keyedit program in the package. Uniterm will also allow you to use "Meta-keys"
(<meta> and <key>) == (<key> + 128) .

Here is a test for swedish characters (One letter on each line):

Å
Ö
Ä
å
ö
ä

And danish:

Æ
Ø
Å
æ
ø
å

(end of test)

For the record, I'll still say "don't bet on it" but part of me is still saying "wait and see before you spout your typical cynical redundant echo, Hendri!K." There is a thread of rumours that can be traced back to comments made by Bob Brodie two years ago, that indicate the possibility of a TOS PPC project, initiated but then dropped by Atari, and always to have been manufactured by IBM.
No, I don't believe that Atari themselves are working on this secretly in the Nevada dessert with tattoos of Enrico Fermi and Edward Teller on their shoulders.
No, I don't believe that it will turn out to be a massive venture, if it turns up at all, but...
Yes, I *do believe that there is substantial enough reason for it to actually happen (IBM could quickly scoff the existing european TOS users), to actually post this message.

Also for the record, I kinda wouldn't mind if it did show-up...

Source record: 170581
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Checking my manual yesterday, I had seem that there is apin for the Mega2ST for composite. It was in the pinouts of the manual. I gotta create a cable to connect to an old RGB monitor... Got the pinouts for both the monitor and Atari. But the monitor doesn't support sound through that port, so I don'tv know what I am going to need to do to get that to work, probably send that pin to a separate Composite sound port, should work, but can't find either connector at Radio Snack.

So yes, the Mega2ST I got supports a composite signal, though which pin it is, I will need to confirm. I could post the pinouts tomorrow for the Port...

AIFF and AIFF-C are common 'professional' sound formats. Cubase Audio uses
them and they are also just two of the many formats that SuperSam v1.08
will read and write quite happily... :)

>they are all buged...
I don't know which versions you are talking about, but the ones i saw are all
working (maybe some are a little outdated).
If you have PureC/TurboC and are daring enough to use a TOS program
with commandline options from a shell, just get the latest sources
of the IJG jpeg library from ftp.uu.net, directory graphics/jpeg, an compile
them. project files for the ST are included. (Yes, i am the one who
provided the PureC project files...)

>You will need lots of Ram, a 4 meg machine would be minimum and run it bare..
Sure ? If you are talking about the IJG programs cjpeg/djpeg, you can restrict
the memory to a little amount, and the program will swap parts of the image
to disk (becomes a lot slower....).

Frank.

It does not contain a CPU but you're right about the *copyrighted*
TOS ROM's that would be illegal to copy.

I've compiled the Xmh mailbox program for MiNT-X, but unfortunately
it needs shit loads of memory (ie, it runs out of mem on my 4Meg f030),
but if anyone with a larger setup would like a copy, they can mail me and
I'll send them a copy (I don't want to upload the binaries until I know
it's working properly).

Craig.

3297. Civilization on Falcon ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-28 15:40:55 UTC
From: akeady@nmrc.ucc.ie
Message-ID: <3ivg67$9ns@bastion.nmrc.ucc.ie>
Source record: 170594

How can the game Civilization be made to work on the Falcon ?
I'm sure there was a thread on this a long time ago, but as I
didn't then have a Falcon I ignored it.
The Falcon 030 list of games compiled by Heiko Hartmann mentions
that a `newer patched version' works without modification.
Where are these patches ? My original version of Civ was buggy
and MicroProse replaced it with one that hardly ever crashes but
it doesn't work on the Falcon as it doesn't seem to recognise the
keyboard. There must be someone out there who has succeeded
in getting it to work ?

Thanks,

Aidan.

I have Stalker 3.02. What is the latest version? Do you have TaskManager set up as an accessory or run as a program? I haven't found a reference about window bleeding but I will continue the hunt.
Have you managed to aquire some neat icons for Neo4 yet? I have tried making some with various degrees of success. If you have some nice files(pun intended) why not drop them to me or post them on the net? Thanks for taking the time!

Well said.

How about, explaining why TOS 1.6 cannot boot up in meduim res? Why is it that you have to text edit a value to 13 (hi res) so it'll boot up medium res.
All computers have their problems.

Far from it, $7 was quoted straight from Les - the author. So I presume
it's correct.
If you're really that hard up, you'd have been better off making your
plea direct to the author, rather than to the general public. He does
read the ST newsgroup quite often. Perhaps you should ask him to give you
a copy.
Just because you can't afford a Ferrari F40, it doesn't justify stealing one.

From: rhett@bigwpi.WPI.EDU
Message-ID: <3ivm65$jc5@bigboote.WPI.EDU>
Source record: 170462

i would really like to make my st more portable for the purpose of sequencing. i saw a picture once of a hybrid arts rack mount job that looked pretty nice and i called tech specialties in texas and they still have rack cases for the 1040. does anyone actually have experience with either of these set ups or more preferabley, cases or actual units they would like to sell. i would really like a stacy but for now i think this fits my budget a little better as i can do most of the work myself.
the other thing i got inspired about when reading the techspecialties catalog was the idea of housing my good old st in the same case as a souped up pc. again, does anybody have any experience trying this out? i plan on starting this project soon, but i want a better st to work with before i start, say something on the level of a mega 4 or better (including the 1040Ste, Mega Ste, falcon, or even the TT if money permits). i was particularly intrigued about a comment in the catalog about sharing peripeherals but more than just hard drives. in specific, the possibility of the pc to use the st's midi ports. this would be pretty neat.
anyway, any help/advice/equipment for sale at really dirt cheap prices as i am poor college boy atari st die hard would really be appreciated!
thanks for any and all replies

I'm still here, Hendrik, it's just that I seldom respond to the name "John." While that may be my legal moniker, it brings to mind visions of toilets and/or prostitutes' clientel, both of which I'd rather avoid any direct reference to. :)

And as far as the "bet" is concerned with Kim, it seems to me that it was largely a case of miscommunication and besides, it had deteriorated to extreme silliness (and a total waste of bandwidth), anyway.

The fact remains that they (principally, Apple) are just now including this tidbit of semi-worthless knowledge in their advertisements solely as a means of competing with Intel's clock-'bumped' DX2 & DX4 chips. These are not new 'improved' Moto chips, just new advertising gimmicks.

But like I've said before, "itjusdudnmaddamate." :)

Bravo! Bravo! Bravo!

Well spoken, indeed. It's NOT just the minimal amount of money involved.
It's the lack of respect and common decency that really hurts.

After all, NO one in their right mind develops shareware software for the
Atari with any real hopes of making much money out of it (hmmm... same
could be said for _MOST_ commercial developers, too). It's the love of the
machine and admiration of fellow users that drives authors on.

Many thanks for sharing your thoughts.

Yeh, I used to think AtariWorks was pretty much the most worthless word processor I've used of late... and then I tried MS Word 6.0 on the Mac.

Ackkkkk!!! Takes up 18Mb on my hard disk, takes 1.3 minutes to load, has a "loverly" Windoze-clone interface, is slower than <insert profane adjectives here>, and isn't even crashworthy. Oh yeah, a GREAT upgrade. Thanks for nothing, MicroSloth.

Word 5.1 is OK, but maybe it's time to reconsider WordPerfect? At least there is always Steno on the Falcon. :)

: full Oberon-2 implementation? How about support? Is it shareware,
: public domain or commercial?

: Thanks in advance.

: Andreas

If I remember right ST-Oberon is Oberon, not Oberon-2, nor is it a full implementation. However, there was also a shareware version of Oberon-2 for the Atari ST which I think you can download from neptune.inf.ethz.ch. This version supports the language only. It has library modules which resemble Modula-2. On top of this it seems that the archive is damaged. I don't know if anything has been done to rectify this. I recommend that you use Oberon for another computer platform if possible.

: in the chain.

Hmmm, that's the _opposite_ of what I've always read... the SLMC
controller has a DMA passthrough on the back and it has to be
the first thing plugged into the computer... I've always had
mine set up that way.

The problem I have now is trying to connect _two_ harddrives
plus the SLMC. The TT has an internal drive and if I plug the
SLMC into the ACSI port on the back of the TT, all is well. So
far I have not found any permutation of connections which will
let me have both the SLMC _and_ my external TOADFILE (with ICD
host adaptor and SCSI pro utilities) connected. No matter what
the order, I get ghosting on all laser printouts. [To be more
specific, this only started after installing a SCSI tape backup
drive in the TOADFILE case. Before, when it was just the internal
and external hard drives, the setup would print fine... Any
ideas??? I can still print if I completely disconnect the
TOADFILE from the computer, but it's _so_ much faster than the
internal TT drive, I have most programs installed on the external
drive...]

ASH are selling v3.5 now, and this one also runs under MagiCMac.

Address:

Application Systems Heidelberg GmbH
Postfach 102646
69016 Heidelberg

Tel.: +49/6221/300002
Fax : 300389
BBS : 303671

I don't know if this program is still available in English, though :-(.

One problem: Signum!3 still isn't OS compliant, AFAIK, that's what has
been critisized by German magazines when v3.0 hit the market and still
those fixes haven't _solved_ the problem, they have just worked around it.

> Actually while that is true chronologically, TOS 2.6 (which came out
>*after TOS 3) also supports 68030s. That is the TOS used on Jim Allen's Turbo

But 3.06 is much faster than 2.06, as it contains 68020 code.

The PAK runs much better with 3.06 (patched version) than with 2.06.

Ooops, I still got soap dripping out of my ears ...

Nah, I just don't think the Falcon is THAT great. For special purposes, e. g. music, it is great. But other than that, a used TT or PAK or cheap MAC with MagiCMac is a much better way to go. IMHO of course :-)

I don't like PeeCee's that much as well. But I can handle 'em pretty well. And if you have the right setup, working with 'em isn't all that bad.

In the company I'm working for ATM, they still use PC-GEM (net'ed together using TokenRing for the AS 400 server). I LOVE it :-))

3329. I'm a brand new mega ST owner: Help!

Newsgroup: comp.sys.atari.st
Date: 1995-02-28 21:10:33 UTC
From: nggilber@cca.rockwell.com
Message-ID: <D4qAtM.BqE@lazrus.cca.rockwell.com>
Source record: 170466

Well I've done it. Went and bought me an Atari.
Now, I know anything about these and still know nothing
as I didn't get any manuals with it.

I own an Amiga 3000 (very very nice!), Apple IIGS (2, My wifes), TI99/4a
I have owned a commodore Amiga 500, Amiga 1200, Amiga2000, C64 and C128.
I Did have a Apple Mac running in my A3000 by emulation (worked great)
and did last easter week-end for less than 48hrs owned a 486DX from best-buy and would have taken it back on E sunday but they were closed.

And now, an Atari Mega ST with B&W Mon and Emagic Notator Logic Midi Prog.
I have the manuals and all for Emagic so no problem there.

Is there any info on the atari one can obtain?
Maybe someone out there has a manual they can Give/sell me.

I have a pretty good idea whats going on and I can just run Logic
as is and need to know no more.
I want however to know more!

Any info would be helpfull.

BTW: I like it so far!

Thanks,

Neal G

>a kind of GEM based "visual GFA basic". I'll post more when I upload...

Well, that sounds just about crippled enough, just below the knees ya know?
From my point of view it would be important to see how it prints, so allowing,
say ten prints to be made , would give me a really good idea as to the quality
as this would depend on your printer drivers (unless you use Speedo/NVDI/GDOS
of course - do you?)
Or alternatively, the capability to export/save in another format say 5-10
times would allow me to judge how usefull pictures created in your program
would be imported into pagestream or calamus for example. If I can create
great drawings in Munch, but they just become scrambled eggs in calamus I
would tend to lode interest, non?
As regards the Atari market, it may be small, but I feel inundated!! I've
downloaded tons of software and keep almost none of it. There have been so
many drawing/paint programs I've downloaded I have lost track - hey - I may
have even downloaded your program, but may have tossed it for the reasons
mentioned above - I couldn't test it. But I can't remember if I did or not.
There's a program that I think I might keep called PAD, so I better send off
my fee A.S.A.I.G.T.$. Do you know PAD, can you objectively compare it too
Munch?
I understand that you don't want to give away the fruits of your sweat, but I
think you have to remember that people have to know that the program will do
what they need it to do. Is it possible for you to only allow 5-10 file
exports per program? Or maybe fewer eh? It just occured to me that 'some'
people might just download multiple copies, and when their 10 free exports
expired, de-compress the next copy. (We have names for people like this) So
maybe 1 or 2 exports per program in order to keep the hassle level too high
for abuse, but still enough to give you an idea.
I've also seen developers talking about how many downloads their program got
compared to the number of registrations they received! Perhaps you feel that

once someone downloaded your program it wouldn't be possible that they would not rush their money too you for the fantastic program you've written. Therefore almost everyone who has downloaded your prg is using it without paying for it! Reality check. I download a lot of stuff I am curious about, but have no use for at the time I download it. I download it to satisfy my curiousity and to see if perhaps I do have a use for it! If you're not getting enough registrations, perhaps you should look at the perceived usefullness of your program, and the competition. Ask the writer of GEMview how many registrations he's received, hopefully more than 20! (he's got mine anyway)

Hope this was usefull
Thanks/merci
-ken

OOOPPPS> I may have goofed. Not being familiar with Munch. Did you say that only pictures larger than 640x400 could be saved in your format, therefore pictures smaller than 640x400 could be saved in alternate formats? If that's the case, that isn't crippleware at all!

Do any members from the Atari Developers Assoc. have any input vis-a-vis unrestricted software and crippleware releases?

It may have been a demo of MagiCMac. MagiCMac allows a Mac to emulate and ST running MagiC and works well for serious software, or so I've heard. Unfortunately, you are stuck with MagiC - you can't run something decent like MiNT/MultiTOS on it...

What I can't understand is why you would want a PC or Mac when you could keep your Atari???

Hope that helps,

OK, I'll withdraw (parts of) my posting. Came to think of it NEC bought the
design, developed it a bit or two. That chip (renamed?) was used in some
of the earlier pc-emulators for the ST.

To get back to the main subject: Medusa T60

Julian F. Rescke mentions this machine as if in existence in article:
"Der ATARI-Markt ohne ATARI", ST-Computer feb-95..

I think he is reliable.

I believe it had some memory management hardware or something that made it
attractive to developers of embedded systems. Unfortunately it had
problems running some 8086 code so was not used in PC clones apart from
RM's.

Yes, my old school bought lots of 386s and a few 486s from them a couple of years ago. Their recent machines aren't bad but I reckon the school could get better deal elsewhere.

Can anyone recommend a decent HD backup program (HD -> floppy) for a 2.5 Mb. ST? One which offers incremental backup would be particularly useful. I'm using a Minix filesystem so it would have to be able to run under MiNT and handle the extended filenames.

Thanks in advance.

Nick.

3347. MagiCMac Demo

Newsgroup: comp.sys.atari.st
Date: 1995-02-28 23:38:42 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9502282234.AA07016@ilmen.lanl.gov>
Source record: 170482

I just finished trying out the MagiCMac demo for the first time and I must admit, I am duly impressed! It appears to be quite stable and compatible and entirely familiar. Plenty fast on my 660av, too.

Can't wait for the 'real' version to be released (hasn't yet, has it?) as I'll definitely buy it if they produce an English language version.

BTW, has any kind soul gone so far as to translate the readme on the disk ino English? Would be nice to know what it said. :)

Anyhoo, congratulations to the folks at Applications Systems Heidelberg. Looks like a winner to me!

-Hutch- @ Fair Dinkum Tech

P.S.: Thanks to Hensa for making the file available and thanks to John Moon of Oz for uuencoding and sending it to me.

3348. For Sale Mega 2, Color Monitor, Laser Printer, Megafile 30

Newsgroup: comp.sys.atari.st
Date: 1995-03-01 01:02:07 UTC
From: earth@best.com
Message-ID: <3j0h2f$qri@news1.best.com>
Source record: 170376

I have a Mega2 with SM124 monochrome monitor system for sale.
The system includes a 2 year old SC1435 14" color monitor that
I have used only a few times because I do mostly writing on the system.
A Megafile 30, with some preloaded software.
An SLM804 atari laser printer that is working fine but needs a new drum to make
the output look better.
A couple of Gravis (nice) Joysticks, a couple of dumb joysticks
and several original games.
Timeworks Desktop publisher
Microsoft Write
WordPerfect 4.1 (no docs available, I guess I lost em last time I moved)

Problems: The floppy drive in the mega2 is out of whack and reports errors
95% of the time. I dont really want to have to fix it to sell it.
The printer really needs a new drum as the current drum is making
streaks. I still use it to do writing for personal use and some for school,
but it needs a little more love than I have. If you've never used an SLM804,
you dont know what your missing. It compares in speed of printing to
the most expensive printers available and is 10-20x faster than my
epson stylus.

I will sell this in parts if you would like.
I will accept any reasonable offers I recieve.
Please send requests to "cindy@earth.vip.best.com"

: >also contributed to the low registations of Munsch; from what I heard it's a
: >very nice program.

First, the name of the program is Munch (after a norwegian painter). Yes,
mono only limits my market. I have only a mono monitor on my MSTE, and
would not really want to get a color monitor, the resolution w.o. a
graphics card is really not good enough... That leaves the Falcon, but as
I have not got one, it may be difficult. I *had* intended mainland Europe
as my main market, as I know very little about the ST's fate in America.

: Let's get one thing straight. Crippleware is and can not ever be shareware.
: Shareware is a fully working program without any limits, were you just
: trust the users that they'll registre. Crippleware got limits.

That is a valid definition, but AFAIK slightly crippled programs are
very commonly called shareware. And as improved/updated versions more
often than not are available to registered users, the distinction is not
that clear, in my opinion.

I don't quite understand what you're trying to do but, you can run the Scart (a.k.a. EuroConnector) of a television from the monitor output of an STF. I have one here.

(N.B. The lead is wired up differently for Sony TV's I gather)

Bigger TV's, rather than domestic portables, often have a 'scart' socket...

Hope this is useful...

I'd like to see the Gemulator run the Burning Illusion demo, or any game that tweaks the hardware to the max. It's been my experience with emualtors of *all* kinds that they never do everything right, even if they do the things they can do, faster.

The PC joystick just can NOT emulate a digital stick at all - for games that require 4 or 8-directional input. About 3/4 of the time you can get your player to go left instead of up..... but try a diagonal. Where does the second joystick go???

I'd like to try putting in ST Gauntlet and see if it runs on a PC.

James

I don't have "big problems," I've used PCs extensively since 1988. I
fully understand how to set them up; I'm no expert, but I've assembled
PCs (who can't nowdays) and had several up and running. I STILL SAY THAT
ADDING CARDS IN A SYSTEM CROWEDED FOR IRQS CAN BE A SONOFABITCH for
less-experienced users. The same can be said for juggling that memory,
editing those CONFIG.SYS files to emulate either EMS or XMS with EMM386.EXE.

>
> Maybe you shouldn't be messing around with all this stuff if it's so hard
> for you..?

Maybe you should go hang out in comp.sys.ibm and pester those folks. The
only reason you're here is to "beat up" on Atari folks, criticize their
machines, criticize them for using Ataris, impose your pro-PC views
ona crowd that really doesn't give a damn, and to (somehow) try and
feel "superior" because you use a PC now. Sorry....I really don't care.

In the depths of your ignorance, the only way you can interpret my
dislike for certain aspects of the PC is that "it's too hard for me."
You must have recently gotten your first PC and you're still wowed and
seeing things through those rosy PC glasses....you won't even concede to
the KNOWN FACT that PC's are notorious for being full of quirks and
strange problems....like non-linear memory....cryptic files. Why do you
think the Macintosh has maintained a market share? Some people don't
want to deal with that....like the Atari users, but Mac has a much larger
share. I don't expect you to concede ANY of this, becasue you're simply
unreasonable and you feel you have something to prove. Please go prove
it somewhere else....NOT in comp.sys.atari.

>
> I don't see anything contradictory in anything I posted.. I said you install

> the hardware and make any changes necessary, then go ahead and use the new
> card... nothing contradictory there.

You reduced the perplexities of juggling IRQ's and juggling
base/hi/extended/expanded memory to "make any changes necessary" and then
asked what's the problem!!! That's like a nuclear regulatory comission
saying "All we have to do is dispose of the waste. What's the problem?"
Once again, I don't expect you to concede anything. If you were
reasonable, you'd be out of comp.sys.atari and in comp.sys.ibm and impose
your views upon that crowd.

>
> Let me ask you this:
> Have you ever installed a network card in an Atari ST..?

Nope.... Do you develop one and have it for sale? Gee...in my "no-slot"
520ST??

> Have you ever installed a 16 bit stereo wave table synthesis card in an ST..?

Nope....I find the standard sound satisfactory for games, but I have
plugged in a MIDI synth and used it with games. Fabulous sound, 2
cables.

> Have you ever installed a SuperVGA accellerator card in an ST..?

This is getting tiresome. Of course not....where would it go? Tell you
what...since you seem to think you're on to something with these
quesions, I'll pay you $50 to install any of the 3 in my external-drive
520ST (stone age). Included in the purchase price will be a statement
from you that you'll leave comp.sys.atari forever, or refrain from PeeCee
propganda slinging and Atari bashing. Both are fine, but they're not why
I specifically subscribe to comp.sys.atari rather than
comp.sys.peecee.propoganda, which is where YOU belong.

>
> Pretty easy to say there are no confilcts or configuration problems there, eh?

Yes.....that's what I like about the old ST. Plug it in, turn it
on....adequate sound and graphics for good arcade games....modem, WP,
then turn it off (by snatchig the plug out of the socket at any given
moment, if I feel like). I'd have to agree with you.

>
> Now let me ask this:
>
> Have you ever tried to create a working ASSIGN.SYS file..?

Never touched one. Never had the need to - TOS 1.0. I'd like to find
out. On the other hand, I've done hundreds of CONFIG.SYS files on the
PeeCee and I find the process tedious, inefficient, and unreliable at times.

> Have you ever tried to explain to a frustrated Atari owner how to create one?

Nope....explained to ***MANY*** PeeCee users. Most didn't understand (co-workers who got a "family PC" and just had me come over after work and sort out the bugs. They want to run Word for Windows and play Wing Commander. They don't know or care about SYS files. Unfortunately, they need to learn if they run a PeeCee.

> Keep in mind the ST has fewer problems because the ST is a simpler system.
> That doesn't mean it has none...
>
> Computers are just computers. The more complex the system, the more complex
> the problems.

"Computers are not just computers." PeeCees are hampered by MicroSloth. Peddling lazy, unoptimized code....slapped and wrapped. Did you ever wonder **WHY** you can run a windowing environment at all on old STs, Amigas, and Macs (8Mhz systems - hell, Amiga users claim pre-emptive multitasking), yet on the PeeCee, even the fastest of all 386 machines is a slug? Ever give that any thought? Microsloth and Intel **LOVE** all these lazy, slow programs. Makes the job easier for Microsloth, and Intel just welcomes the new business as every PeeCee owner is always clammoring for the next generation system because his Microsloth software runs so slowly on the one he has now. If the PeeCee user is so willing to upgrade, Sloth need not try very hard to produce optimized software....why bother when they'll buy a new machine to run your slow programs faster?

ATARI - "LOVE IT OR LEAVE IT." COMP.SYS.ATARI.ST - "LOVE IT OR LEAVE IT."

'nuff said. I do not wish to discuss PCs on COMP.SYS.ATARI.ST any longer. That's not the reason I subscribe here. Go post your reply on some PC conference....but don't be too surprised if I don't subscribe to that newsgroup and reply.

I am curious, however, to know WHY you pester Atari users so? Are you here for flaimbait? Must be. Do you feel "macho" and "superior" for using a PC? Do you think Atari users are willing recruits for you to "beat up" on? Do you think Atari users care about your PC, or your views on PCs, or a PC user's (you) views on Atari? No...they come here to read Atari and and write Atari.....and it's high time that I started reading and writing Atari.....got it?

] > be somewhat happier.
]
] Gemview will do the conversion (3.10 is the latest version).

GEM-View doesn't do a terribly great job of dithering 16-bit JPEG's down
to 8-bit (256 color) GIF's too well. Speed of light does a better job,
and does it pretty quickly. The latest Jpeg-5 release does a better
job still, and is only marginally slower. Then, once converted, view
them with Photochrome in ST-Ham or STe-Superham mode, and be impressed,
I certainly was considering it's only an 8Mhz machine which is only
supposed to show 16 colors on-scren :)

Note: In medium resolution on TOS 1.4, 1.6 or 1.62, look at the
"Desktop Info" dialog from the GEM desktop. You will notice that the
multicolored Atari logo is using a lot more than 4 colors - even
Atari doesn't follow their own rules :)

I hate to to butt in here, but I've installed and upgraded several Unix
systems with only minor problems compared to what I've run into with DOS
box systems.

>I don't see anything contradictory in anything I posted.. I said you install
>the hardware and make any changes necessary, then go ahead and use the new
>card... nothing contradictory there.
>
>Let me ask you this:
>Have you ever installed a network card in an Atari ST..?

Don't need it - built in.

>Have you ever installed a 16 bit stereo wave table synthesis card in an ST..?

Nope.

>Have you ever installed a SuperVGA accellerator card in an ST..?

Yep.

>
>Pretty easy to say there are no confilcts or configuration problems there, eh?
>
>Now let me ask this:
>
>Have you ever tried to create a working ASSIGN.SYS file..?

It's pretty easy. You click on "install.prg". What's the problem? The only problem I see is when people start messing around with them by hand.

>Have you ever tried to explain to a frustrated Atari owner how to create one?
>
>Keep in mind the ST has fewer problems because the ST is a simpler system.
>That doesn't mean it has none...
>
>Computers are just computers. The more complex the system, the more complex
>the problems.
>

Wrong. To site an example, several of the Tandem fault tolerant mahcines. 3 independent CPUs. Two service processors. Mirrored SCSI drives. Dual SCSI controllers. Four independent ethernet boards. Twin V.25 boards. Twin memory boards. An ungodly number of independent power supplies. Yet I've had fewer and simpler problems with them than with some of the DOS boxes. The Tandems are very versatile, and it's usually very easy to install new boards and software.

There are in fact two Oberon implementations for Atari. There is an
Oberon-1 compiler by Martin Momberg which is public domain. My
own compiler implements full Oberon-2 standard with some extensions.
It is shareware. For more information, contact me at home:

Wer kennt das folgende Problem mit EASYPROMMER, MEGA-Adapter und PINATUBO?

Benutzt jemand den MEGA-Adapter mit dem EASYPROMMER und PINATUBO und hat 27C010A-10-Programmierprobleme? Merkwuerdig ist auch, dass (bei mir) die Stromaufnahme im 5 Volt - Pfad in Richtung Schaltregler (TL497) mit fast 700 mA (!!!) erschreckend hoch ist. Dies also nur waehrend dem Programmiervorgang. Wenn ich kleine EPROMs (27256), also ohne den MEGA-Adapter, programmiere, steigt der Strom nur unmerklich an. Ich hatte leider bisher noch keine Zeit dem Problem tiefer nachzugehen. Da vielleicht jemand anders schon die selbe Erfahrung gemacht hat, stelle ich hier trotzdem mal kurz diese Anfrage und waere dankbar fuer Forwards oder E-Mails an mich. Das Problem scheint nicht softwarebedingt zu sein. Ich habe zwar schon lange die Version 1.8 , das Problem ist jedoch mit der aelteren Version 1.6 unveraendert. Ich habe in der Zwischenzeit auch mal mit dem Entwickler des PINATUBO, Michael Schwingen, Kontakt aufgenommen. Leider konnte er mir bisher auch nicht weiterhelfen. Aber wie bereits angedeutet, es scheint nicht an der Software zu liegen.

Sorry, dass ich in dieser NG nicht in Englisch schreibe. Ich wollte mir Zeit sparen (meine Englischkenntnisse lassen gruessen...) und glaube, dass diese EPROM-Programmiergeraete, den MEGA-Adapter, der urspruenglich aus der ST-COMPUTER stammt und PINATUBO hauptsaechlich im deutschen Sprachraum zu Hause sind.

Freundliche Gruesse
Thomas

3371. Falcon Audio Modifications

Newsgroup: comp.sys.atari.st
Date: 1995-03-01 09:38:00 UTC
From: "Sven Bornemark"
Message-ID: <ftn_2.200.136.56$fidonet.org_2f5440eb_Sven.Bornemark@p56.dada.ct.se>
Source record: 170497

A while ago I described the modifications made to my Falcon.
Since it now sounds so good, I would like to share the complete
modification procedure, so that fellow falconeers can enjoy the
same *high quality sound* from their F030s.

Warning! This sort of work should definitely be carried out by
a qualified technician, since it includes replacing of teeny-
weeny components. Besides, it could affect the warranty as well.

FALCON HARDWARE MODIFICATIONS
as described on p. App 1-24 in the Cubase Audio Falcon manual

(Quote)

*To remove the bass boost on the output:
? Change C58 and C59 from 100PF to 1000PF.
? Change R123 anr R130 from 10K to 15K.
? Change R59 and R68 from 100K to 4.7K.
? Change C95 and C90 from 0.033yF to 1K Resistor.

*To reduce the speaker amplifier gain:
? Add a 100K resistor between pin 2 of U21 (@R119) and
AGND (@R111).

*To reduce the Input Gain by 6dB:
? Remove R56, R57, R90, R92, C21 and C81.
? Change R66 and R87 from 100K to 47K. (+) See note below!
? Add a 470pF NPO +/- 5% in parallel with R67.
? Add a 470pF NPO +/- 5% in parallel with R88.
? Add a 100pF NPO +/- 5% in parallel with R66.
? Add a 100pF NPO +/- 5% in parallel with R87.

(End of quote)

(+) [This is where Sven Bornemarks mod differs: this line
should read: *Change R66 and R87 from 100K to 1.8K.*
By doing so you end up with a sensivity of approx.
-10dB, same as most domestic HiFi gear]

I've also had the Clock Buffer Modification carried out on my
computer, but I'm unable to say for sure if this mod has had any
significant effect. All works fine, however.

Thanks to all Falcon owners out there who showed interest in
learning more about these sonic improvements on our beloved
Falcons!

Yours sincerely

-Sven-

In message <793879218.4@cs.york.ac.uk>, Andrew Hague wrote:

] From Gasteiner's reputation I don't
] think I'd ever buy anything from them. Are they a better company than they
] were about 2-3 years ago?

I would avoid them if possible too. I don't know what they were
like two or three years ago, but if they were worse than they are now
then they must have been completely and utterly useless. Sorry for this
long post, but it's a long story!

I bought a hard drive from them for my Falcon about six months ago.
When it arrived, (unboxed, just wrapped in bubble-wrap with a sticky topside
where a label had been ripped off it) I found that the mounting bracket does
not come with the drive (no mention of that in the advert) so that cost me an
extra 25 quid. When I mounted that flimsy bit of metal, I found that the
ribbon cable supplied is too short to stretch up to the drive, and that the
drive doesn't even fit in the bracket. After several phone calls to people
at Gasteiner who didn't have a clue about anything, I bent the bit off
metal to fit. At least it keeps the drive off the motherboard.
Now to load the HD driver software. I ran AHDI, and it couldn't
see the drive. After faffing around for a few days, and many more phone calls
to people at Gasteiner who didn't have a clue about anything, I thought -
"sod it, I'll reformat the drive and see what happens". So I did. And it
worked. "I'll never use Gasteiner again", I thought.

This Christmas my wife bought me a scanner from... Guess who!
It arrived in November with no cartridge adaptor, no power supply, no
manuals, and no software, but apart from that everything was there (the
scanner was). After repeated phone calls from my wife to people at Gasteiner
who didn't have a clue about anything, one by one, she got all the parts
except the cartridge port. Not being knowledgeable about computers, she didn't
know what was needed, and Gateiner certainly weren't going to tell her.
Instead they realised she didn't know about it, so just reeled off crap
about the scanner, and generally abused her over the phone.
Come Christmas, I opened my present to find that there were still
bits missing. Over the next few weeks, after talking on the phone to several
people at Gasteiner who didn't have a clue about anything, I got everything
except the Touch-up software. Eventually, the manager at Gasteiner said,
"send everything back and we'll resend a new box", after admitting that
the scanner I was sent was one that had been loaned to them and didn't
work anyway. So a couple of weeks later, I got a new scanner. But no Touch-
up software. I phoned some people at Gasteiner who didn't have a clue about
anything, and eventually received a parcel with Touch-Up in it (that was
last week - three and a half months after ordering a scanner). The only

thing I'm still missing is the Merge-It software, which I got with the first scanner but not with the second.
You never know, I might get everything by next Christmas.

After reading this far, would you EVER use Gasteiner? Do so at your peril!
Paul Hills

3378. Re: DUET Docs -- English Version?

Source record: 170403

Mike Wasinger (mwasinge@nyx.cs.du.edu) wrote:
: If someone out there has installed DUET successfully, could
: they post a brief English summary of the installation procedure
: and operating instructions?

I have tried it with success. very easy. Basically, Duet comes with
modular drivers for you to install.

Go into the DRIVERS folder, and copy the relevant driver into the AUTO
folder. I used the midi drivers. Next, come out of the DRIVERS FOLDER,
and copy both DUETCONF.PRG and DUETCONF.INF files into the AUTO
folder, after the duet driver.

You can edit the INF file with a text editor. The main one is the the
last line, where you can define what drive icon on your computer, is
the drive from the other one. It looks something like this:

DRIVE N C

N is the icon on your computer....while C is the physical drive on the
other. You can have multiple lines here...

Hope this helps.

BLAIR DEAN (bdean@hpb.hwc.ca) wrote:
: Great stuff!! Did you find out what was causing the heavy load?

Yeah...the file table was filling up. A system patch was needed, to
empty the file table, when someone logged out.

Some restrictiopns still have to be kept, hence the restricted login
times, due to the load on the machine, and we are a service funded for
the HE sector in the UK....so they have to be provided with a trouble
free and fast access in the first instance.

>Well, will it. Ther version is 1.8?

I don't know about 1.8 but 2.2 (or whatever the latest version is) does work.
It's quite good actually, much faster than on a ST, especially with NVDI
installed as well.

I have found it is best to run it in the TT compatible modes if possible,
it doesn't seem to like Blowup's custom resolutions.

Hope this helps,
Phil

Yes, I had to use RM for my A level computing. Ahhh!!! They had just got some new RM 486's though.... They had a RM mode program which put them into a compatibility mode which would enable the old (crappy) RM basic / pascal etc. to work....

Source record: 170411

Games are the weakest spot for the Gemulator, because most of them do "break the rules", and going directly to the hardware is almost guaranteed to fail when that hardware isn't there.

It also doesn't support the joystick at all, as far as I know, which eliminates a huge percentage of games right there.

The Gemulator's strong point is running well-behaved applications software like Calamus where someone might have a large investment in software that they don't want to have to give up when moving to a new platform.

It's true that the idea of emulators is usually a lot better than the actual implementation...

From Hungary, are we? So are some of my best friends too. But I can live with that.

> About a month ago there was posted a message about E.P.S.S, a mid
> player for the Ste series. If anyone knows something about it, please
> drop me mail.

E.P.S.S. was written by the gifted Swedish Atari-supporter Conny Pettersson, better known as Copson. The program retails at SEK 300:- (25.00 GBP) here, and there is a "free" demo version too.

Copson can be reached at:

Voice and fax: +46-13 16 41 04
Email : FidoNet 2:204/428.7

E.P.S.S. is a sweet little program that allows you to trigger internal samples in your Atari from *proper* sequencers like Cubase, and save your creations in a format that games programmers could use.

Yours sincerely

I don't know about PD but I use a pretty good serial mouse driver. Actually I
use it for my digitising tablet, but it doubles as a Atari mouse and
PCmouse(3button) driver also. It's CyRel Mouse, from Cybercube in Toronto,
although I believe the programmer is from Germany. Cost? about 20-30$

Well, I have a few friends with PC's and when I visit them they _need_ to
change to make one program run. To make another program run they have to change
something else. They have had PC's for about 10 years so they are _not_
beginners.

AFAIK the problem running Tempus on a 030 machine is simply it's 24 bit
addressing. There is a small auto-folder program coming with Tempus Word
that programs the PMMU to accept these addresses, so You could ask for
this or look for something similiar on an ftp site (there should be some
utility doing this since I saw it once, but cannot remember where:)).

Hope That Helps,
bye Sascha

>*very* commonly called shareware. And as improved/updated versions more

And that is wrong.

>often than not are available to registered users, the distinction is not
>that clear, in my opinion.
>

How do you expect people to registre a program where not even the programmer
can give a real definition of his program. I have seen PD program where
the author was aking for money. I have seen shareware with limits in. I've
seen crippleware without limits..Geeh, i have even seen PD with limits in.

How do you expect people to know right from wrong with things like that.

I know the programmers are only trying to make a few buks from their programs
but i honestly don't understand why they keep mixing the definitions up
like they do. Even worse is, when an author of an shareware program starts
screaming about piracy only stated from the fact of how many times his
program has been downloaded from a system.

Don't get me wrong, i like Crippleware, Shareware and PD alot. It's the
thing that'll keep our enviroment alive. I just wish the programmers could
get their definitions right sometimes, and not start blaming the users
when they do not make a living from their program.

Thomas,

d > I desperately need a programm to recover lost files on a SCSI
d > drive on my TT030 !

First, if you expect to recover those files, don't WRITE anything
new to the drive. Once a file is marked as deleted, it will be
overwritten if you save something new to the disk.

As for software to undelete programs, I'm not familiar with any
Shareware/PD programs, but I use Diamond Edge for this. Works great!
You can purchase Diamond Edge from Oregon Research, and from most
Atari Dealers such as TOAD computers. Diamond Edge also defragments
your hard drive, improving access speed.

Good luck,

Anthony Watson

A> Also, they are apparently very opposed to a PowerPC version of MagicMac,
A> and intend to fight the production of such a thing. :-(

Ofcourse they are. They don't want people to buy power macs to run
ATARI software on them. MagiCMac is much better and faster then system 7,
so if MagiCMac was able to run on the PowerPC the software companys would
make the programs run under MagiCMac insteed of under system 7! ;)

Just a thougth.

> Does anybody have practical experience using ST-Oberon? Is it a
> full Oberon-2 implementation? How about support? Is it shareware,
> public domain or commercial?

Im not shure, if it's wise to announce this already, but i'm trying to implement
the Oberon System for Atari Computers, since I have 5 weeks of hollydays now.
But don't expect too much from me for the moment. As for the compilers I can
say that the compiler from Stephan Junker from what i know supports the full
Oberon-2 standard, but also adds some extensions to it, what i personally don't
like so much about it. On the other hand the GEM-Library is very good, but
i don't know yet, if i'm going to support it in the Oberon-System, or if
i'll create my own Library. You may write me your oppinion on that.
Also, if there are some people around, willing to help me a bit, i would be
glad to hear from them.

greetings

Simon Egli

Actually, I've never tried the demo that you have mentioned, but I have
run quite a few programs that 'tweak the hardware' and they seem to work.
Unfortunately, the Gemulator cannot read most protected disks, so many
of the games that I've wanted to test can't run cause I can't get them to
read. BTW, the Gemulator can read the standard Atari format just fine.
>

> does the second joystick go???

It's very easy to emulate an analog joystick on a PC. Haven't you
ever seen the Gravis gamepad for the PC? Also most PC joystick ports
can support two joysticks with a special y-cable. The biggest problem
with the gemulator (along with no MIDI support) is it's lack of
joystick support. Both of the problems are supposed to be resolved
in the next version of the Gemulator software, but for the time being
you just have to live without them.

>
> I'd like to try putting in ST Gauntlet and see if it runs on a PC.

I would too! If only I could get my copy of Gauntlet to read, AND I
had joystick support. (Darek are you listening? :))

3416. Modem bargain

Newsgroup: comp.sys.atari.st
Date: 1995-03-01 17:16:42 UTC
From: smoore@chowgar.demon.co.uk
Message-ID: <794078202snz@chowgar.demon.co.uk>
Source record: 170382

British Telecomm Networking Modem (NS 2232b model)

Features (taken from the manual)

* User friendly configuration using AT commands ot the internal menu system.

* Full network management facilities.

* AT and V.25 bis auto calling/auto answer using internal number store, log on sequences, passwords and dial-back security.

* Automatic Standby Switching/Switchback.

* Synchronous and Asynchronous operation.

* Error correction and data compression to V.42/V.42 bis or MNP4/5.

* Line connections: PSTN and 2 or 4-wire ALC.

* Tone, pulse or mixed dialling.

* Circuit tests - loop, self-test, BERT.

* Multiple levels of password security.

* Fixed or variable number security dialback.

(end of features page)

This is one hell of a nice modem with about a million other features that I don't even have a clue what they are. The reason I'm selling it is because every now and again it won't make a connection but if I wait a while or tap the top of the unit it works fine, maybe a loose connection but I haven't a clue about this sort of thing. Because of this I have ordered a new modem today which while not as good, has all the features I need whereas this one is wasted on me really.

The unit retails at over a grand but all I want is 100 pounds including delivery.

Anybody interested ??

Regards.

>What makes you think more than 16 people are using your program Eric ?

While not concrete evidence, of course, the download count from various commercial services (GEnie, CIS, Delphi, etc) can give one an idea of the level of interest, at least, in any shareware program. If these download counts are hundreds of times more than the number of paid registrations, it's easy to put two and two together. And this does not include the number of copies gained via ftp.

>Let's get one thing straight. Crippleware is and can not ever be shareware.
>Shareware is a fully working program without any limits, were you just
>trust the users that they'll registre. Crippleware got limits.

Garbage! I see nothing wrong whatsoever with shareware that is fully functional with the exception of a few key features (such as SAVE). As long as it is functional enough to give the user a good understanding of how the program works in real life, there should be no complaints. In fact, it would seem that the only people that DO complain are those that wouldn't pay the shareware fee anyway. It's just piracy in another form.

This argument surfaces every few months in this newsgroup. And the same tired old arguments are always presented. Give it a rest.

What exactly does TOS do with this clock (I mean is there code in the ROMS
to read a certain location & set the keyboard clock).

I was considering building my own (Dallas chip) & was wondering which
memory locations to use. I would be better off using the standard as I
have TOS 1.04.

Is it documented somewhere?

> keep your Atari???

Well, there are at least a few valid reasons, I would think.

If, for whatever reason, an individual has the need to run Mac or PC software, a reliable and fast emulator might make sense. Desktop space is at a premium for most folks and the fewer 'boxes' the better. If the emulator is solid (crashworthy and compatible) and runs considerably faster than the 'real thing' then it's worth considering. I admit that there are frequently trade-offs when using an emulator so it's a decision that must be made by each individual based on their needs.

But for me, I know that I would be most interested in running my Atari software on a fast 040 platform; especially on one that I already own.

>Really ? That sounds intereting. What does your company do ?

Sell Atari and Olivetti computers. The HP is on the other side of the shop, and the Falcon is connected to it through the mentioned cable.

The 35000 cps throughput (erm, make that "up to 39000 cps" for certain cases) is done by an accelerator driver software written by myself. Stock Falcons do up to 4500 cps.

It's called iPRN.

Anyone want this driver? It's shareware, I'd only need some guy to handle the US registration stuff.

Even with all that aside, the biggest reason I can see for the Barracuda taking so long is all the other stuff that is in it. Steve Cohen (the developer) has likened it to a "computer within a computer". It is not just an accelerator, it also has two VME buses, a 50 pin video socket, a memory upgrade, and it also speeds up the Falcon's bus speed to give you additional resolution without an extra card (similar to the "Speedresolution Card" from Germany.) Somebody was saying something about a 96001 DSP too, but it wasn't Wizztronics (but don't quote me on that part...) There is also the capability to add the Video Funnel and an 80486 for 'whatever you would use an Intel chip for.'

As should have been mentioned already, the Gemulator is NOT a good choice if your primary interest is in running ST games on a PC. Many games use some rather, ah, unorthodox approaches that don't work well under an emulator. Sound and joystick support is another yet to be resolved issue.

For most productivity apps, the Gemulator seems to work pretty good, but it's certainly not for everyone. As is often the case, an emulator is seldom as good in all tasks as the 'real thing' but still might be worth considering.

I just got myself a Xerox 4045 Laser Printer and Photocopier, for a measly ~$150US. It will copy okay, and accepts text from the Atari without any problems whatsoever, but.....

The electrostatic drum, on the left hand side, is coated with toner, and whenever I print anything, the left hand side of the page is a black blur. Is there some way I can fix this, or does the drum have to be replaced? (I forsee hideous expense!)

Also, I can't get it to print any Graphics from the ST, and the manual isn't terribly helpful as far as telling me what printers it is compatible with. It is obviously graphics capable judging that it will photocopy stuff, and the manual _says_ it can handle graphics, but is there anyway I can get this thing to handle graphics? (Printer driver etc.!?)

If I can get this thing working, then it's a pretty cheap printer, and photocopier :) (Heck, a Dot-matrix would have cost me more than this!)

Any ideas on drivers and/or fixing the toner-sticking-to-the-drum problem!?

Richard John Kelsch (richcsst@crash.cts.com) wrote:
: The problem with Geneva is that it is only a multitasking AES. It only
: multitasks GEM applications. It does not multitask GEMDOS or BIOS
: routines. They are still the "old" single-tasking routines. Therefore,
: if two different programs wish to use the core system resources (disks,
: etc.), then they are going to make TOS very displeased.

This is simply not accurate. While the current version of Geneva does rely on cooperative multitasking, saying that the original poster's problems have anything to do with this fact is totally incorrect. In fact, it is because Geneva does NOT use preemptive multitasking that is it so much faster and more compatible that MultiTOS. All of the poster's questions are, in fact, answered by the Geneva manual.

Neither MagiC nor MiNT do anything special to the pre-existing GEMDOS of BIOS. They simply tack code on top of it that allows it to multitask preemptively. Very little is actually needed to change at the BIOS or GEMDOS levels. The hard part is getting programs to work well together once you have added preemptive multitasking.

Geneva 003 and MiNT do not get along. However, for the next version of Geneva, 004, I am working on MiNT compatibility. This will provide true preemptive multitasking, as well as all of the other nice file functions that are part of MiNT. 004 should be out in May, and we are going to put out a newsletter when it is available.

I can't tell you as I don't have Geneva, however I think Geneva would need some re-writing to operate under MiNT as Geneva, apart from being an AES, must have it's own Multitasking kernal. I think the AES part of Geneva would not operate with any other kernal for a start, and the Kernal and AES are probably lumped into one programme knowing how Neodesk is. So, I don't think it would be possible as Geneva is. Of course I may be wrong, as I don't have Geneva.

3444. Falcon external HD installation problems

Newsgroup: comp.sys.atari.st
Date: 1995-03-01 21:16:09 UTC
From: v_white@ece.wisc.edu
Message-ID: <3j2o6p$cj4@news.doit.wisc.edu>
Source record: 170449

Friends

I recently purchased a bare bones Falcon, and I'm having trouble
installing an external hard drive.

I started by installing the AHDI.PRG in the /auto directory.

Thus, when I rebooted, it recognized the hard drive, I got the message

Device 0 - Micropolis
Device 1 - Maxtor
Not Boot loaded

(which is very hard to read as it flashes on the screen only a tiny
fraction of a second)

The "not boot loaded" command is reasonable, as I was booting off the
floppy.

Then, when I finally get to the gem desktop screen, I only have the two
floppy icons, trash icons, and what appears to be some generic
hard disc icons (for drives D: and E:), which are there regardless
of whether I have the scsi stuff connected or not.

At this point when I run the HINSTALL.PRG, and do an install,
I see no drives highlighted as being available for mounting.
All I see is a matrix of drives, up to about H:, which are all
in "Half-tone" sort of signifying they aren't available for mounting.

I am ignored when I click on them.

I can quit the program and go back normally to the desktop.
But there's no hard drive installed.

There's no cherry bombs or anything. Just no available drive.

Any ideas??

Thanks!!

Victor White

Actually, the majority of games fail because of their copy protection schemes.
Gemulator doesn't do well with nonstandard disk formats.
As far as hardware is concerned, although it's true that the Gemulator doesn't
have any hardware, it does emulate at the hardware level - ie. even software
that "breaks the rules" should still work. In other words, although the
hardware isn't physically there, it does exist in a virtual ST. You can
peek and poke to your heart's content, and the Gemulator should behave
properly.

>

I've never used either apart from briefly at shows, however the Janus should be faster on moderate PCs, with the Gemulator possibly faster on better systems. The Janus has 68000 (@16Mhz IIRC) on board so does not have to be emulated. Apart from when in some compatibility modes it uses the x86 and possibly the graphics card to accelerate most VDI functions, so the graphics are very fast and colourful. On graphics speed it beats a TT on a mid range PC.

No, it's also the fact that it writes directly to the screen - with the patch you describe it should work on the Falcon in ST high or medium, but it won't work in any of the other graphics modes that most Falcon owners choose to run in.

One little mistake!!!! :-)

Seriously though, I would like to here from any fellow TT owners about their success/failures while using the machine.

I mainly use my TT for programming (mostly GFA Basic and a little assembler), with a little DTP work thrown in for good measure.

I am currently writing an Off-Line reader to replace the NOS utilities.

The program is currently titles OASIS.

The program is a single application supporting both Usenet and E-mail in a GEM enviroment (windows, menus etc.). OASIS is totally compatible with the NOS file formats for news and e-mail.

I hope to be uploading OASIS to several FTP sites in the next few weeks, I will let everybody know when I have done this in comp.sys.atari.announce.

Future versions of OASIS will include the replacing of the NOS On-Line code with something more suited to the Atari platform and a GRAPHIC WEB BROWSER!! (don't hold your breath on this one!).

Any comments/wish lists for the OASIS package would be most welcome.

(I am still waiting for the EDITOR Dave!)

I am hoping I can simply patch my brand new, just installed Geneva and make
it compliant with Mint for less than an 'arm-and-a-leg' as I can now see
that I need to install Mint to take care of my multitasking needs.

> By the way, have you ever had to explain to someone why their Atari ST
> won't boot because an AUTO file program is in the wrong order..?

And have YOU ever had to explain to someone that there MPEG files won't run because their driver was overwritten by another installation program that doesn't care about what it finds in it's place, but if it doesn't agree with it, it sholdn't BE there and erases it?

I see NO reason for the advocacy of PC's over Atari's on the point of installation because THERE ISN'T ANY. PC's have more problems because of the plethora of add-ons around, where the Atari simply has those that user's of that market's machine are going to actually USE.

Oh, and sales staff? On a visit to our local PC superstore, a comms friend of mine asked the PC Texpert if they had a running version of OS/2 Warp he could have a look at, to which the rep. replied that they didn't unfortunately as they were trying to eliminate a few bugs(AFAIK). To which my friend (who happened to be picking up his P90 at the time) asked if he could take the advertised Beta copy.
After much frantic re-configuration of an office PC (about 45 mins, all told) we were looking at a '486 playing chess with itself, playing Mah Jong with itself, itself, itself, and itself, playing some bundled form of Patience, and some other menial Windose work. I don't think that my comms friend was a real expert on PC's, but we got VFM out of the deal. And I vowed never to touch PC's on the basis of sales advice, ever.

This tale shows the sort of people who seem to be qualified(!) to sell PC's to the public, yet can't 'just configure the rest of the cards to match the new one'. With regards to advocating the PC market, it belongs in the realm of applying Health and Saftey At Work Regulations to Willy Wonka's Chocolate Factory. Get Real!

Right, so you keep to your PC ('*just* reconfigure the !!!')! The reason that you are having difficulty here, is that you've only just come across some ST users that KNOW what's going on in the box! If I told you about all the PC users that I've met that DON'T ... but don't take my word for it, ask any medium-sized company's Micro-support desk ...
User: There's nothing on the screen.
Helpdesk: Can you give me the serial nunbers, please?
U: I can't actually read them.
H: Why not?
U: The lights are all out (sic) ...

Garbage you say, why not just say it's crippleware insted. Not only is
it the truth, it's also more easy for the users to understand.
What does it hurt for an author to say it's a crippleware program he has
done, rather than a 'fake' shareware ? You better tell me, cause i can't
find of any reliable excuse.

And excuse me, are you calling me a pirate Hutch ? You should know better
i guess. And calling me a pirate based on my previous message is a very
low life comment. You could do better unless you have no idea what you're
talking about, which i believe is one of your problems right now.

Hmm .. I think for most uses, a box where the line is in the center of a
character box would work well for most people. A little GUSERDEF goes
a long way!

>The problem I have is that any kind of bitimage (image,icon,cicon) will

That won't always work. You could try v_bit_image(), but I'm not sure how
fast it is. It would be OK for a couple icons and such at startup I bet.

>Also remember that when you call rsrc_load() it automatically rsrc_obfix().

Which is why I tend to not mess with RSC fix-up routines.

3466. Re: My monitor is interfering with the soundon my Mega STe

>so using the ports is the only way for me to get sound. Help!

Evidently, when your monitor's sound blew it screwed up internally and
is now routing some noise back through the the sound in-put line. This
makes alot of sense. If the amp blew in the monitor the ... hmm .. I'm
no EE so I don't know the technical term, but its kind alike a feedback
line that controls gain, anyway, that would feed right back into your
computer and likely into the RCA lines. Or perhaps its just a bias problem.

In any case, the monitor =IS= the cause. Just cut the sound line from the
cable to the monitor internals.

For anyone interested in obtaining toner for SLM604/804 and SLM605/805 in Australia I reproduce the following letter for your info

As discussed I have been able to locate a source of supply for High Quality Compatible Toner Cartridges to suit both the Atari SLM605/805 and Atari SLM604/804 Laser Printers, and accordingly advise the following details/prices.

SLM604/804 $49.50 per unit $47 per unit for orders of 6+

SLM605/805 $43.00 per twin pack $40 per twin pack for orders of 6+

All prices are inclusive of both Sales Tax & Delivery in the Hobart (Tasmania) Metro area.

Australian Laser Charge (Tas)
22 Berega St
Howrah, 7018
Ph (002) 442 470
Fax (002) 447 655

Cheers,

Peter Hopson

PS The last price quoted by Paragon for Atari Toner for SLM804 was $139.00 per unit & $79.95 for the SLM605 twin pack

3470. Harddisk on TT030

Newsgroup: comp.sys.atari.st
Date: 1995-03-02 04:33:52 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3j3hrg$9it$1@perth.DIALix.oz.au>
Source record: 170223

FOR ANYONE INTERESTED

I have just purchased a Quantum Lightning 730 MB drive for my TT030 with Tos 3.06 UK. It is SCSI 2 and very fast. I do use ICD Pro drivers though and I would strongly suggest either these or some other than the Atari AHDI as they work properly with SCSI 2 commands. They are also much faster than AHDI and I have had less data corruption problems since using ICD Pro Drivers. I have also partitioned my HD with the following C:12 megs DE: 100megs each FGHI: 130 meg each without any problems. I previously had a Conner 170 meg drive which performed flawlessly for 18 months or so. Just look for Mac advertisements as these are SCSI drives and usually very cheap. One problem I did have with my new drive is that they use a very tiny 2 pin connector for the drive activity LED and I couldn't find a suitable plug. I simply cut the wires on the existing LED and inserted them firmly and insulated them with a special putty silicone I have. If anybody knows where these small plugs can be purchased it might be of interest. By the way the TT can handle drives that either have parit enabled or disabled.

Anyway have fun with the bigger drive...its really great!!!!

Regards from OZ
Mark

>it now.

You can. There are drivers out there which support it and programs that
read the data and write it to a standard audio files. Besides, the function
calls needed for this are defined and published (look for cdbind*.zoo on
ftp.uni-muenster.de, pub/atari).

Kim Andersen (kim@dksoft.ping.dk) wrote:
: What makes you think more than 16 people are using your program Eric ?

Let's see. It got more than 250 downloads from GEnie alone. You have to think that at least a few of those are using the program. In addition I have recieved messageqs from people who are using it, but who have not registered, and I can't guess at the number of people who have downloaded it from the Internet, local bulletin boards or gotten it from a CD (it has been included on the Crawly Crypt Collection) but I have to think there are probably quite a few. Given that Fansi is a unique program on the Atari, one that chances are, most SysOps of BBSs would be interested in, it's not hard to figure out that there are probably quite a few more people using it than have registered.

: Let's get one thing straight. Crippleware is and can not ever be shareware.
: Shareware is a fully working program without any limits, were you just
: trust the users that they'll registre. Crippleware got limits.

You're splitting hairs. The terminology isn't as important as the results.

> was a driver available that would work on the Falcon. Does anyone
> know?

There certainly are: For printing pictures, try *Imagecopy 3.5x*
(commercial) or *GEM-View* (shareware). Both these programs (and
there are others too) print your piccies, and in colour too!

Printing from *Calamus 1.09 and SL* works fine too.

> Thanks in advance....

You're welcome!

IMO nedit is a nice editor. I have to agree, though, that X lacks
standardization even more than the Atari platform. Just look at all
those applications which are completely different to use...

(Sorry, no experience with NeXTstep).

What I really would like to see is a Gemini-like file manager for X.
All the free file managers I've seen so far cannot come close even to
the TOS 1.0 desktop.

Dan Wilga (alib107@twain.oit.umass.edu) wrote:
: Richard John Kelsch (richcsst@crash.cts.com) wrote:
: : The problem with Geneva is that it is only a multitasking AES. It only
: : multitasks GEM applications. It does not multitask GEMDOS or BIOS
: : routines. They are still the "old" single-tasking routines. Therefore,
: : if two different programs wish to use the core system resources (disks,
: : etc.), then they are going to make TOS very displeased.

: This is simply not accurate. While the current version of Geneva does rely on
: cooperative multitasking, saying that the original poster's problems have
: anything to do with this fact is totally incorrect. In fact, it is because
: Geneva does NOT use preemptive multitasking that is it so much faster and
: more compatible that MultiTOS. All of the poster's questions are, in fact,

It is definitely not true that preemptive multitasking always slows down a
system in a noticable way. The slow down between MagiC 1.x (cooperative)
and 2.x/3.x (preemptive) is far below 1 %.

: answered by the Geneva manual.

: Neither MagiC nor MiNT do anything special to the pre-existing GEMDOS of BIOS.
: They simply tack code on top of it that allows it to multitask preemptively.

This is definitely FALSE concerning MagiC. Please do not tell lies! MagiC has
(since V 1.0) a newly written BIOS and a newly
written GEMDOS that does task switching etc. MagiC 3 even multitasks
floppy and harddrive access, i.e. it is able to copy or format in the
background without noticable slow down. Furthermore MagiC's GEMDOS is fully
reentrant. Furthermore MagiC 3 has an interface
for installing device drivers. Drivers are being developped that are capable
of knowing which process owns which device or interface.
MagiC has never used any part of the old ROM operating system. It was a
stand alone system from the beginning.

: Very little is actually needed to change at the BIOS or GEMDOS levels. The hard
: part is getting programs to work well together once you have added preemptive
: multitasking.

That is also NOT TRUE. You have to make sure not more than one process
using any device at the same time. Furthermore you have to make sure that
task switching is not blocked during device I/O. And make sure that all your
code is reentrant when task switching can occur.

I understand there are no written laws on these matters, only general
opinions, but I never read or heard that *true shareware* must be
fully working programs!

In my not so humble opinion a small amount of "cripples" are fine. I'd rather
have that than loads of irritating pop up menus making me feel miserable!

If there are commonly and widely accepted rules for these matters, could
anyone please update me? And if so, don't forget to include the origin of such
a "document"!

>...it does emulate at the hardware level...

Sounds like Darek did even better than I'd thought..!

Trapping direct writes to the hardware and still running as fast as it does
is pretty good..!

I remember when Dave Small was developing the Mac emulator and having seemingly
random crashes all the time, only to find out that a LOT of Mac programmers
had been "sloppy" and forgotten to initialize variables, so the first deposit
to one of them would try to write to location zero. That was fine on the
Mac, since its ROM starts at 0000, but on the ST it generated an exception
since the system wasn't in 68000 supervisor mode. Dave ended up having to
have the emulator watch for those situations and trap them before they could
crash the system.

Unfortunately I think I tossed the last newsletter from BraSoft that told
what the new features of Gemulator version 3.0 will be. Since I still run
my STe next to my PC, I don't have any immediate need for ST emulation...

Not reliably. Due to the crappiness of the PC "architecture" (I'm using the term loosely, just like the PC industry does), you need an I/O card with a 16550 UART (basically, it's a serial-port handling chip with a fairly large buffer), otherwise you'll lose data a lot.

>GEMulator is a pure software-emulator.

Hendrik, I think what we're saying is that the Gemulator needs a piece of hardware (the Gemulator card and TOS ROMs) to work with the Gemulator software.

You're correct that the emulator doesn't use any kind of ST hardware like a PC emulator in an ST usually uses a "PC on a board".

I think we're thinking of something like "pc-ditto" when we think of a pure software emulator.

In <D4LsD2.8z4@crash.cts.com>, Richard John Kelsch writes:
>Well, you see, if TOS were "improved" to be multicompliant like Apple's
>PowerMAC System 7.5, then you could run multimode software on that there
>PowerPC. Software that says "Accelerated for Power Macintosh" doesn't
>necessarily has 100% native PPC code. It does, however, have mixed
>code. The routines can be multilingual. So, if a PowerPC TOS were to be
>created, then both 680x0 TOS programs could be run as well as
>"Accelerated" PPC TOS programs. This means cross platform compatible
>software.

This isn't possible AFAIK with the TOS binary format; the Mac binary
format easily handles this due to the strange database-like file
structure they use.

>Picture this, a program that runs on both machines (680x0 & PPC), but
>when it is executed on a PPC it loads a special "plugin" that recognizes
>it's run on a PPC and executes the code in native PPC code. That is how
>Apple designed the interface and how TOS could also be modified.

We don't even have dynamically-loadable code, so TOS would require LOTS
of modification, or every program would have to include the code to do
it (*bloat*).

>Also, the system routines would be in native PPC code. Have you ever
>seen a PPC native program run? I have, and I have a PowerMAC (in
>addition to my ST) and it is unbelievably fast! Keep in mind, this
>processor can emulate, in software, a 25MHz 68030 easily (remember PC
>Ditto on your ST? Slowwww). Now, that's faster than a "native" running
>Falcon! So, if it is so fast emulating, then think how fast it is native
>code. The difference is phenominal.

Who's going to re-code TOS (which *still* has lots of 680x0-specific
assembly in it) for the PowerPC? Certainly not Atari.

>Besides, now that Apple is slowly moving to the PPC line, they will use
>less and less 680x0 chips. That means Motorola will eventually have to
>discontinue development in the series (remember 6809?) as there will not
>be a market for them. Atari is not enough to give Motorola an incentive
>for further development and manufacturing.

Apple is _slowly_ moving to PowerPC? I think they're announcing 1-2
68040-based systems this year; the rest are all PowerPC, including the
laptops.

Motorola will probably product 680x0-series chips for a LONG, LONG time;
Apple's chip demands are a small amount of what Motorola sells. Systems
like the SuperNES and Jaguar use 68000 chips, and many other systems use

them as well for specific tasks (AFAIK, nobody else uses them for game consoles or computers).

>Remember when the shift was made from 8 bit to 16 bit? There is a
>current market of 32 processors. However, the PPC (a 64bit CPU mind you)
>is the next step in technology. Soon the older designes will be phased

All of the current PowerPC chips are 32-bit. The PowerPC-620 will be the first 64-bit PowerPC chip, and I don't think it's in production yet.

>out. Technology moves on. Sure, the 68060 is the state of the art for
>the 680x0 series, but I will bet it is the last of the line for that
>series. Motorola will just use its "integer unit 'CPU 32'" in their
>microcontroller line when all is said and done. Incedently, the 68060
>uses the same technology as the PPC, but with a CISC based execution unit
>instead of a RISC one.

68060 has been a known dead-end for several years. Motorola was not willing to go through the hoops Intel is going through to produce the P6.

>One last thing, what's wrong with combining a 68060 and a P603 (PPC) in
>the same motherboard???

The 68060 is *expensive* and the PowerPC-603 is cheap, and FASTER. Why would you bother? It'd just drive up the price of the motherboard.
Atari clones are already priced way out of reality.

Actually, this is beginning to wander too much from Atari stuff, but...

>Well, I have a few friends with PC's and when I visit them they _need_ to
>change to make one program run. To make another program run they have to change
>something else.

Usually the only things that will need different startup configurations like
this are games.. with a lot of newer games using DOS extenders, it's just
easier to do a "clean boot" by holding down the SHIFT key (with DOS 6.x)
when MS-DOS starts to boot.

Also with DOS 6.x, they can set up multiple startup files (very much like
using something like CodeHeads multi-boot program on an ST) so they can just
hit a key to use a different configuration.

In "most" cases though, once everything's been set, the only time changes may
need to be made is when something new is added, and not even always then.

I know that user interface is important, but surely this should have been
your first thought about this prog..... <grin>

|> So, anyways, can anyone direct me to PD or at least cheap DSP .MODS
|> playing source? Thanks.
|>
|> Hmm...
|>

Hmmm... Well, the BiMaster of BTM (or something like that...) code is part
of the assembler library FALCLIB ..... It has a couple of bugs though, and
relies on a pre-assembled kernel....

Or, if your feel like doing something special, you could check out the
(again assembler) fast_dtm code. This is Jaccard Emmanuels DTM player code.

Both of these are available over FTP from falcon/programming directories
on most ftp sites (cnam.fr has them IIRC)

Hope this helps.

Anthony

>MiNT, still ignoring the HSMODEM docs.

Well I've spent the previous weekend and several evenings trying to find
out what goes wrong with hsmodem and MiNT 1.12, well 19K2 doesn't work
reliable (at least with RTS/CTS handshake) wherever you put hsmodem....

I still can't put the finger on the problem. It seems to me that the new
Mint version is severely broken for speeds >= 19k2 at least on a normal
ST, with tos 2.06. 9600 baud seemed to work well.

This isn't the first time I had troubles with Hsmodem and Mint. I had it
running stable once using Mint 1.10 (pure C 1.1 compiled) and running
hsmodem before mint.

I too examined the Mintlibs I'm using (pl44). It could be that programs
compiled with this code might (????? not quite sure yet) be broken.

Anyone suggestions.....

I also recently upgraded my TT030 with a 540 Fujitsu harddrive but sometimes while initializing the drive the ICD driver only displays two partitions with about 200 MB each instead those 5 partitions. All data are srewed up at this point and rebooting is the only way to solve the problem.

Could it be, that I have to install the drive as SCSI 1. I have only the ICD driver but not the ICD pro driver.

I think the original poster was _quite_ serious about his request, Rog.

> also Hutch you are to paranoid about all that Copying stuff..

Who me??? Yeh, could be, mate. But I tell you what, Rog. Why don't YOU spend 2 or 3 years developing a commercial application and tell me how YOU feel the first time you find it on a pirate BBS?

Until then, don't even _attempt_ to tell me how I or any other software developer should react about software piracy issues. Sheesh!

Look on CIX in atari.st/2listings

Or on numerous ftp sites (eg atari.archive).

You'll be tearing your hair out unless you've got an FPU, though.

>a joystick then? Can you give specifics on the sound? Can you get any real
>sound if you have a good sound card in the PC or will the gemulator not use
>it?

Well, for the real info, you should email the Gemulator author at
darekm@microsoft.com who can fill you in on the current status of the
product. Darek has been quite active in supporting the product and making
enhancements for it so perhaps some of these issues have been addressed.
I sold my Gemulator about a year ago so I may be a bit out of date on the
latest capabilities.

Atari joysticks are still a no go, AFAIK.

Sound was not supported in the last version I tried. Ask Darek.

Undoubtedly, it should blaze on a 90MHz Pentium since a 486DX33 gives you
roughly 8MHz ST speed and a 486-66DX2 gives you MegaSTe speed or better.

As others have said, there are still some tradeoffs involved, but it does
work pretty well. You should try to demo one if at all possible.

AR>: to sales. How many new copies of Pagestream do you think Soft-Logik could
AR>: sell today? Not upgrades, _new_ packages. Very few, I'd surmise.

Their attitude wasn't conductive to make me want to deal with them. I bought another Atari and in the packet was a disl of their earlier Desktop Publishing program. As I could figure out how to do about everything but get the pictures and other graphic material imported to the page I wrote and showed them that this was indeed a ligitimate disk.

They would not answer a question or offer to sell me a copy of the manual for this package. Instead they suggesdted that I just spend $495 and get their latest version fo Pagestream. Gee I already only paid $49.95 for Fleet Street with full manuals from E. Arthur Brown and had bought Express Publisher at a Walmart closeout (PC they DTP) for $15.00

So why should I even consider their modest proposal?

Maybe this is not the best place for this, but I've downloaded the MagicMac demo, and I want it. I can't get through to the creators, Application Systems by phone, but did try to send a fax. It went through, but without confirmation.

So, anyhow, my question is, since there appears to be no US distributors for this, how can I get this package? Do they have an on-line area (hopefully in English, too)

3528. Re: Mac does ST!

Newsgroup: comp.sys.atari.st
Date: 1995-03-02 18:06:03 UTC
From: thomash232@aol.com
Message-ID: <3j51eb$sbs@newsbf02.news.aol.com>
Source record: 170294

My reasons for wanting MagicMac are pretty straightforward. I have a souped-up up Mega with Turbo 030, 16 megs of TT ram, and Crazy Dots.

1. Speed
2. More colors
3. HD floppy usage
4. Calamus SL

At this point, if my Mega goes up, I will not (short of a marketing miracle) buy another Atari computer. The Medusa is nice, but way too expensive. I already have a Mac (Quadra 660av), and at least I can still get hardware for it (as opposed to the Atari).

Secondly, I feel I've invested a lot of $$ in software, and prefer many programs to the ones on the Mac, like Calamus SL, STalker, STraight Fax.

So, hopefully most, if not all, will be totally compatible, and if so, will probably sell my Mega.

Tom

Everything's gotta go, I'm under orders to get rid of my "junk".
Listed prices are immediate sale, first-response-gets-it prices.
If no one matches that price, I'll sell for the best lower
offer I get in the next few days. Buyer pays shipping.

ICD AdSpeed STe - $100
16 MHz accelerator, for 1040STe only. Solderless plug-in
installation. (I would say "easy installation", but you do
have to take the STe apart.)

Atari SM147 monitor - $75
14" flat screen monochrome monitor, no internal speaker.
Slight distortion around upper left corner, but not something
that I ever really noticed during general use. Only used a
few hundred hours.

Monitor Master and mini-speakers - $30
Allows push button switching between color and mono
monitors. Has an output jack for the speakers, which are
are Labtec CS-150's (use 2 "C" batteries each, not included).

Atari mouse - $5

Atari (2600 style) joystick - $2

3542. Can we start a demo list?

Newsgroup: comp.sys.atari.st
Date: 1995-03-02 22:23:11 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950302135600.25671C-100000@PEAK.ORG>
Source record: 170285

I've been recently scraping up demos that I could find for the ST.
Needless to say, the Europeans write the best demos! After watching the
"Burning Illusion" demo, my hat is off to them!!!

I don't have many demos, yet over the 10 years of the ST, I am sure that
there must be many of them. Here's what I have so far:

1) BOINK - ST version of the Amiga bouncing ball.
2) FUJIBOINK - spinning/bouncing Atari fuji with 512-color(???) scroll
3) LCD- "little color demo" - mostly sound, but neat colors
4) JUGGLER- ST version of the Amiga demo
5) COL-DEMO -- doesn't do much but throw up a pallette of more than 512
colors. They flicker, though.
6) BALLIT- little chrome ball bounces off a mirror, next to other chrome
balls. Simple, no sound.

Those were all I'd seen, until BURNING ILLUSION! I can't express how
impressed I was. I didn't know my ST had it in it. That's what has me
craving more of these demos....particularly the high-quality ones, like
what comes from Europe.

How about starting a list of demos? Everybody, post your favorite, plus
a few honorable mentions. An FTP site to get them would be nice, too.
The few that I have came from the umich archives, mirrored at my school
in Oregon (ftp archive.orst.edu - look in pub/mirrors/archive.umich.edu/atari

There were a few others, but they require a meg (poor me). That's the
subject of another message (RAM).

James

3543. stone age 520ST RAM!!!

Newsgroup: comp.sys.atari.st
Date: 1995-03-02 22:37:02 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950302142354.2003A-100000@PEAK.ORG>
Source record: 170286

I have a stone-age 520ST - that is, external drives. It's only 512k!!!
I need an upgrade. Short of sending across the country to Toad
computers, can you experienced users suggest some RAM upgrade options?

I remember back in the old days, it was common to piggyback RAM chips. I
am *NOT* an electronics person (I wish), so I know little of this. It
seems like there were some resistors added, and some control lines added
that had to be connected to the MMU. Is there a text file somewhere that
explains how to do this procedure?

I've heard differing opinions on the solderless upgrades. Some people
say that they come loose, give sporadic errors, etc. However, since I
can't find **ANYBODY** who will work on an Atari, I thought I might try
this. I called TOAD computers, and we talked about this upgrade for a
moment. When I said that I had a "stone age" model without internal
drive, they said that these are a little harder to work on, and that it
might be advisable to send in the computer and have it installed.

Right now, it looks like I'll have to send in the computer. The only
problem I have is that it seems like if I pay shipping 2-ways on the
computer, and pay for a memory board (accepts SIMMs, I presume), then it
seems like it would be a waste to stop a 1 meg....Compared to the "fixed
costs" of getting an upgrade at all, why not throw in 4 and be done with
it? That's expensive, of course.

That leads me back to thinking about the piggyback upgrade. 1 meg would
probably suffice on this particular computer. I live in Oregon. Does
anybody know of somone around the Portland area who will perhaps
"moonlight" upgrade?

Is there any technically-minded Atarian out there who might be willing to
consider moonlighting to do an upgrade? (I'd mail it)

Does anybody know what is the cheapest method of upgrading to a meg? Any
hobbiest smaller shops that work on Atari?

Thanks very much or any suggestions you may have.

James

3545. looking for a catalog

Newsgroup: comp.sys.atari.st
Date: 1995-03-02 23:32:11 UTC
From: dalewis@cs.buffalo.edu
Message-ID: <D4u6pn.4C5@acsu.buffalo.edu>
Source record: 170302

hello,
I was wondering if someone could point me to where I could get a catalog
of atari parts/equipment. Is it possible to buy atari equip/hardware over
the net (through commercial sources)?

If it's in the faq (is there one?), mail me the faq or tell me where it is :-)

dough

>That's stupid... you set it up once and leave it alone.

Obviously you've never had to:

1) Add a new piece of hardware to your PC
2) Play a game on your PC
3) Put your PC on a network

And you're probably not too concerned about making your system more
stable.

>By the way, have you ever had to explain to someone why their Atari ST
>won't boot because an AUTO file program is in the wrong order..?
>
>It seems computers are computers, no matter what brand name is on the
>outside of the case...

But some are far less annoying than others; with a Mac or Atari with
some sort of boot manager it's _easy_ and fast to get past a buggy piece
of software that's locking you up during boot. With a PC, you have to
boot from floppy. Oh, so fast, especially if you're running OS/2.

>sure how wise that is, hence the post. I do
>think your definition of shareware leaves precious few "real" shareware
>programs, though...
>

I have nothing against crippling at all, but calling such a program shareware
is just something i have a problem with. Shareware and crippleware is not
the same, but you guy's want it to be. And when you can't get away with
that, you start shouting piracy, (like Hutch did). That is not playing
fair, as it'll leave no alternatives to the users.

You can do with your program whatever you want, but if you make somekind of
limits it's no longer shareware, and therefore shouldn't be named shareware.

Thats really all i'm saying.

One thing though. I really would like to know why you insist on calling it
shareware when it's crippleware. Whats the reason ? (Perhaps Hutch should
answer this).

Greets
Kim

>My first machine was a STfm fitted with a 360K drive.

Yes.. Atari released the STfm originally with a single sided drive, and shipped them that way until they used up their stocks of those drives, at which time they started shipping double sided drives as standard.

Many of the original systems were converted to double sided drives, but every now and then one of them shows up with the single sided mechanism intact.

The STfm also used the 1040ST motherboard, but with only half the RAM installed, which meant the memory could be doubled on the board, at the cost of some tedious de-soldering of the unpopulated RAM area.

> ...you've only just come across some ST users that KNOW what's going on
>in the box!

Umm.. Raymond... I've been doing Atari user support on CompuServe, GEnie and Delphi for over 10 years now... I've come across a few ST users in that time, some of whom know the machines in intimate detail, and others who aren't sure which side of the disk goes up.

Atari systems have problems just like IBMs have problems and Macs have problems... that doesn't make any of them any better or worse than any of the others, just different.

>installation because THERE ISN'T ANY.

My question was NOT meant as "advocacy of the PC over the Atari", but as an
illustration of the fact that EVERY system has its problems.

Running down a different brand of computer because it may have problems
does NOT make any other system any better.

Re: Upgrading a 520St...

The very best way to upgrade a 520St is to take the money you'd spend on a memory upgrade and buy a used 1040STe.

Seriously...

The 1040Ste uses industry standard SIMMs, and can be expanded to 4 Megs VERY easily and inexpensively.

It also has some enhancements in the area of graphics and sound over the 520, has a blitter chip, and comes with a much improved version of TOS, all installed and completely reliable.

Any "memory upgrade" done on a 520 ST will by contrast be expensive and far less reliable.

I bought a 1040STe with 4 Megs of RAM in it for $125 last year. I paid far more than that for the 520ST memory upgrades I've had in the past, and was never fully satisfied with the way those upgrades worked.

Check ads on local BBSs for people selling used STes, and watch the articles here for similar deals. The overall results will be far more satisfying...

: mean to lose it and rant and rave there. Sorry, guys.

That's okay. I feel the same way, too ... piracy used to mean ripping off megalith corporations who, it was assumed, could absorb the losses without batting an eye. But that isn't the case with Shareware. Both are expressly wrong, but shareware piracy hits just that much closer to home because there just aren't any middle-men; you're ripping off the author directly, and that's just about all there is to it. I don't like it, either. I think it is inevitable, and a fact of life, but I still don't have to like it for that.

udem148@bay.cc.kcl.ac.uk wrote:
: Do most .MOD music files carry the same standard? For instance
: can one use the likes of ST Protracker or ST TCB tracker to play say Amiga
: music MODS, or are there slight modifications needed for compatiblity
: and if so what are they?

It is generally accepted that .MOD means 4-channel ProTracker-type music MODule. There are, however, exceptions...

TCB Tracker does not conform to any standard; its MODs are proprietary, and usable only by itself and Audio Sculpture, which happens to support TCB MODs.

There are also a number of MOD formats in the PC world that can be 6 or 8 track format ... these can not be loaded by ProTracker.

Additionally, there are Oktalyzer MODs, which can only be loaded by Oktalyser on the STE and Amiga, and by (I think) Screamtracker on the PC.

But for the most part, most MODs are 4 channel Noise/Protracker format. Some MODs (Protracker ones) use CIA timing -- a method of extending the tempo ranges, and for that you must use a ProTracker compatible player (or ProTracker itself) to play them at the proper speeds, or remove the Fxx speed commands (unless the speed commands are under F1F)

: I know there are various standards for samples - WAVS+AU (PC's),
: SND (macs) AVR RAW etc, and format conversion progs around - no probs here.
:
: Any hints appr.

: -Al, udem148@bay.cc.kcl.ac.uk-

: P.S: In the meantime, I'm gonna expt. a bit and see if there are
: any compat probs.

There always are ... but for the biggest repository of MODs on the net, check out Aminet. The main dist. site is ftp.wustl.edu in /pub/aminet/mods and there you will find literally thousands of them. (Including a few of mine... :-)

All that xmkmf actually does it to filter the makefile template
through the C preprocessor after adding some #include's of
configuration templates, and postprocesses the output by re-inserting
backslashes at the places that are marked with `@@'. I should not be
too hard to do that by hand.

Z > I have Stalker 3.02. What is the latest version?

the latest version is 3.04; you can upgrade it via patches being made available by Gribnif through the nets. You'll need a patch to bring it up to 3.03, then a patch to bring it up to 3.04. It basically makes it more compatible with the Falcon, as well as allowing for some new options like the ability to toggle the blitter on and off. They're also working on version 4, which should be out by the fall.

Z > Have you managed to aquire some neat icons for Neo4 yet? I
Z > have tried making some with various degrees of success. If you
Z > have some nice files(pun intended) why not drop them to me or
Z > post them on the net?

You're in luck - a friend of mine at TAF has uploaded several of my 3DIcons files up to HENSA - hopefully Danny can tell whether or not they're available now. They're in monochrome, but I've heard from people who've been using them in medium res and TTs to good effect. Hopefully I'll be getting a Falcon soon (or, if not, a multisync monitor) so I can start working on stuff for the colour crowd. Also be on the lookout for a file consisting of 243 icons from Fred Zimmerman - some of those are pretty sharp!

And as, like me, you are a Gribnif fan, look out for WORLDCLK.LZH - it's a program by Dan Wilga that puts a small map of the world on your screen and allows you to click on cities and determine what time it is there. He's only asking for chocolate if you're registering it (I'm going to contribute some unique Canadian examples of which when he shows up at ACE '95 :)).

... Just hand over the chocolate and nobody will get hurt. - Troi

Resembling ST-World woud be no bad thing, as ST-World was the best serious
ST magazine ever published (english language). It's reviews were deep, it's
programming section VERY good (published how to do software overscan before
the technique was even used widely in demos, etc).

I live in hope.....

3578. Chimera - Tried It, Liked It.....

Newsgroup: comp.sys.atari.st
Date: 1995-03-03 11:40:57 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3j6v89$e2r@whitbeck.ncl.ac.uk>
Source record: 170113

Well, I finally got round to installing & playing with the Chimera WWW browser
for MiNT-X last nite, and it's well funky. Nice, fast(ish), it's not as good
as Netscape, but it's almost identical in functionality to Mosaic.
Contrary to the posting by the guy who did the port, it DOESN'T max out the
memory on a 4Meg machine - I run Fvwm as my window manager, and I can still
launch Chimera from the window manager with the GoodStuff button bar providing
me with 4 1600*1200 desktops (ok, things are getting a little tight by then....).

Tried it over a 2400baud dialup link & performance was acceptable if you turn
on delayed picture loading. I could see it being really good over a faster link.

Verdict: Recommended, the best WWW browser available for the Atari. All MiNT-X
users should get it ASAP.

Craig.

: think your definition of shareware leaves precious few "real" shareware
: programs, though...
:
: Vegard Hofs?y (vegard@interlink.no)
:
:
The other possibility for your program receiving comparatively few
registrations, may just be the cost. DM60 (I seem to recall) is on the upper
limits of shareware fees, equating to about ukp50 by the time bank charges
are added. Most shareware being priced at about ukp10, $15 etc., there
-could- be just the faint suggestion of profiteering (no offence intended).
As many commercial programs are now available for not much more, (Calamus
1.09 for ukp59, for instance) it could be argued that this view is
justified.
Whether your program is actually worth its fee doesn't seem to get
considered :-(

Some programs it is impractical to cripple - file selectors come to mind -
but "serious" applications such as yours, I feel, need it.
I still feel that crippling the SAVE (and probably PRINT) function is your
best bet. Whether you change the fee is up to you.

>And you can't use it for nothing, can you ? It doesn't show a damn thing
>Hutch.

Actually, it does tell you a few things; if you track the download counts,
you can see a trend. If 200 people download your program one month, then
200 the next month, then 200 the next month, and 200 the month after that,
you would have to be blind not to notice a trend. The Atari market is
not growing at all, so continued downloading of a program month after
month (each time there is a new release) is a fairly good way to see what
is going on. I do not scream and yell about "stealing" and "piracy" when
people do not register and yet continue to use the product. The decision
is up to them.

An objective comment; since adding a "nag" box to MasterBrowse and ESS-Code,
registrations have increased noticeably. They are still not flooding in,
but they are more numerous than before. That is the only thing that I
did to the program. If I had, say, disabled other features, what would
have happened? I'm not sure (and I do not plan to do this, BTW).

>>>Let's get one thing straight. Crippleware is and can not ever be shareware.

>find of any reliable excuse.

Think for all of ten seconds and you will see why not. The name
"crippleware" has very bad connotations. What you do not seem to realize
is that words change meaning over time. There was a time when Shareware
meant you had the complete working program with no disabled features.
It no longer means that, now. Now it means you have the program and you
can take a look at it and use it, but you have to pay before you can do
anything productive with it (such as save your work).

When I say stereo, do you immediately think of an 8-Track? I think of a
CD. The meaning of the word has changed (though the literal definition
may not have).

>>I just want the software to be named their real names, cause it DOES matter.

If you want to change the definition of Shareware, write some... Does that
sound fair to you?

I would say it leaves none; on the PC (which is a much larger market for
Shareware) everything labeled as such has a nag-box or some disabled
feature. The simple fact of the matter is that not many people register
a program unless they are a) honest (and there are honest people out
there) or b) have some compelling need to do so.

: long post, but it's a long story!
:
: <long tale of woe deleted to avoid even more tears>

I ordered a trackball and clock module from them shortly before Christmas.
They arrived within a week, undamaged and functional. Admittedly it was a
"crystal" trackball that lights up, which I'd said I didn't want (but it
keeps my youngest granddaughter happy). However, discretion was decided as
the best course, so I kept the light up ball and left it at that. Seems I
may have made the right decision by accident.
Personally, I'd recommend System Solutions for just about anything Atari in
the hardware line. My MiniS hard drive has been excellent.

Oh for christ's sake Carl, stop jumping on the bloody bandwagon, it was a long
time ago and we've all done embarrassing and stupid things at sometime in a our
past. No doubt he is fully shamed and has learned his lesson the hard way so
I'd be indebted to you if you'd keep your shit-filled gob shut.

Graham

: Right, so you keep to your PC ('*just* reconfigure the !!!')! The reason that
: you are having difficulty here, is that you've only just come across some ST
: users that KNOW what's going on in the box! If I told you about all the PC
: users that I've met that DON'T ... but don't take my word for it, ask any
: medium-sized company's Micro-support desk ...
: User: There's nothing on the screen.
: Helpdesk: Can you give me the serial nunbers, please?
: U: I can't actually read them.
: H: Why not?
: U: The lights are all out (sic) ...

: --
: Raymond D. Lee Email - raylee@witenite.demon.co.uk

Hey Ray, I happen to be an expert with PC's and can get just about any
card to work with any program, but you are right the PC is a horrorible
machine. Getting it to work does require special batch file "programs"
that ask which program you intend to run and configure the appropriate
drivers as such. XMS memory drivers are a joke and the worlds biggest
headache and the worlds stupidest design. Display cards are again the
worlds stupidest design. Paged memory windows for display cards?!
STUPID! Also, the "new" local bus design, a supposed breakthrough in
technology. Hmmm, Apple and Atari have been using local bus since day one.

Every time I have to sit in front of a PC I appreciate my Atari more and
more. Which, by the way, I just purchased a 4 meg Falcon today! Ooooh baby!

Rich

: :|>
: :|> That's stupid... you set it up once and leave it alone.
: :
: :Yeh right! You have to set it up more than once, because you need 1 for
: :windows, and at least one for games...

: strange, I play a lot of games. Never ever did I have to change
: autoexec.bat or config.sys. In fact I have never ever edited these
: files. But I *did* install soundblaster, cd-rom player etc.

Ever notice that the Soundblaster is the ONLY sound card that others have
drivers for?? Get any other kind and you ask for trouble. So, you say
stick with SB. No, SB sucks rocks and there are other cards of much
greater quality out there. However, a SYS and BAT nightmare is in the works.

: :
: :My flat-mate (also a CS student) has to switch his autoexec.bat/config.sys
: :every time he wants to play a game.... Every time, he is in danger of
: :deleting the files....

: Hahaha! Every time I edit a file, I am in "danger" of deleting it?

Yes my ignorant friend. The PC is famous for playing havoc with HD's and
directories when driver conflicts occur.

: :
: :|> By the way, have you ever had to explain to someone why their Atari ST
: :|> won't boot because an AUTO file program is in the wrong order..?
: :
: :Have you tried to explain about config.sys?

: no, and never needed an explanation either.

: :
: :Both autoexec and auto are programs that are run at startup, and their

: :efects can be seen..... but config.sys?

OK dude.

1) High Fidelity Dreams (512K, colour, works on mono but no picture, STE,STFM)
A stunning sound disk from Aura in Germany, with superb 50KHz replay on STE
and 16KHz on STFM. Uses 16MHz for decrunching on MegaSTE.
2) Grotesque (1Mb, colour, STE) Mindboggling flashy, in-yer-face, techno/rave
job by Sweden's Omega. SMOOOOTH screen update and music sampled from Front
242
3) Punish Your Machine (512K, colour, STE, STFM) Another cool two-disker from
Delta Force in Germany.
4) Songs of The Unexpected (512K, colour, STE) Wizzcat's cool sounddisk with
excellent modules and quality. Includes CD player style interface and cool
oscilloscope display of the four voices.
5) Brain Damage (1Mb ?, colour, STE) Aggression strikes with a two disk running
show with tracker music and lots of very good effects, started off by a
totally wicked rendered/digitized animation with sampled sound. Very
competent
indeed.
6) Fish 'n' Chips (512K, colour, STE, STFM) An above average demo from down

under.
Has an ACIIIEEEEDD!! tracker screen for those that like that stuff :)
7) Mindbomb (512K, colour, STE, STFM) *Classic* 20 screen masterpiece from The Lost Boys. Simple reset demo.
8) Ooh Crikey Wot a Scorcher (512K, colour, STE, STFM) The last from TLB (sniff).
A great 3D fractal flight intro where you fly over a landscape to find the demos
which include a fantastic flashy acid screen - "Well, shall we have some more tea ?"
Also a reset demo with quartet music.
